When borne by a bishop it was carried in the left hand, with the crook turned outward, indicating his jurisdiction over a diocese; when assumed by an abbot, it was carried in the right hand, with the crook turned inward, showing that his jurisdiction was confined to the members of his own house. Church Hist.: The name given to those persons who took part in certain risings in France in the thirteenth and fourteenth centuries. It is probable that these outbreaks, of what Blunt calls "religious jacqueries," were due in a large degree to the sufferings of the

peasantry from the exactions of the nobility, and that the hostility displayed to the clergy was a consequence of their connection with the mystery. These outbreaks took place

1. In Berry in 1211. The peasantry pillaged churches and religious houses, and proclaimed universal equality and the coming of the Holy Ghost. (*Lafousse*.)

2. In 1250; the ostensible objects were the rescue of Louis VII. and the recovery of the Holy Sepulchre. The rising originated in Flanders, under the leadership of a person of unknown name called the Master of Hohenay, who, when he reached Paris, was at the head of 100,000 men. Here "they not only usurped priestly functions, performed marriages, distributed crosses, offered absolution to those who joined the crusade, but they inveighed against the vices of the priesthood." (*Blunt*.) They separated into three divisions, and marched southwards, where they were attacked and cut to pieces.

3. In 1320, in the reign of Philip V. This outbreak took place under the pretence of a crusade. The insurgents were excommunicated by Pope John XXII.; and being hemmed in in Carroussanne, numbers perished of disease and famine, and the survivors were put to death.

B. As *subst.*: A grant from the Crown by letters patent of the exclusive right of making, using, and selling some new invention. The Patent Designs and Trade-Mark Act, 1883 (amended 1888, 1901, and 1902), and the Patents Rule, 1890, regulate the law of patents, and the changes have greatly benefited inventors and consumers. The process of obtaining a patent is as follows: An application is made by the patentee, in the form given in the schedule to the act, addressed to the Patent Office. This application must state shortly the nature of the invention, a claim for a patent, a declaration that the applicant is the first inventor of it, and it must be accompanied by a specification. Then, if the application is accepted to, provisional protection is granted, and letters patent can be obtained. For the term of four years a fee of £4 is required. The fees are generally much lower than those formerly demanded, and the procedure in obtaining letters patent has been very much simplified. A patent to last fourteen years costs a fee of £20, which, however, may be paid in instalments of from £5 to £14, an instalment to be paid before the expiration of each year. This latter arrangement, instead of the payment of lump sums as formerly, is an advantage to the patentees of those inventions which find their way but slowly into public favour.

A patent may be assigned in whole or part by the patentee to any number of persons; it may also be mortgaged, and licenses may be granted by the patentee for the use of the patent. In the United States patents are granted only to the absolute inventor, always for fourteen years, and are granted or withheld at the option of the Government Commissioners of Patents. The amount of official fees payable depends upon the country of which the applicant is a native.

* The official pronunciation of the substantive, and of the adjective in the sense l. 1 (2), (3), is *pat'ent*.

Hist.: Whoever under the old Roman Empire built a temple to a god had the right of nominating the officiating priests, and, in the reign of Constantine, to induce wealthy men to found Christian churches the same privilege of patronage was transferred to them. In Britain, as well as elsewhere, the system prevailed, and when a gentleman built a church on his own estate, he was, as a rule, the patron. (*Blackstone's Comment*, bk. ii, ch. 3.) [ADVOVSOS.] During the centuries when Papacy was dominant much progress was made in substituting clerical for lay patronage. [INVESTITURE.] Most of the reformed churches owing much to powerful noblemen and princes, who had assisted them at times by force of arms in achieving liberty of worship, allowed them to continue, or to restore lay patronage. In Scotland it was opposed by the two books of discipline in 1560 and 1571, was swept away in 1649, restored in 1660, again abolished in 1689, and restored in 1712. It led to two secessions in the eighteenth century, and to the Disruption of 1843. The Act 37 & 38 Vict. c. 82 once more abolished it, compensation being accorded to the patrons and the right of electing a minister given to the communicants of the congregation. In the Church of England opposition to the sale of advowsons has recently arisen, and appears as if before long it would become a power. If the advowson of a parish descends to a Roman Catholic he is not allowed to put it in force.

Mr. H. L. Pattinson, of Newcastle-on-Tyne.] To treat for the separation of silver from lead. Lead ores always contain a small proportion of silver. By the ordinary process of cupellation, it does not pay to treat lead containing less than twenty ounces of silver to the ton for the purpose of extracting the silver, but by Pattinson's process that containing as little as three ounces per ton may be profitably worked. This process is based on the fact that the melting-points of alloys of silver and lead are higher in proportion to the amount of silver contained, and that if lead-containing silver be melted and constantly

stirred while gradually cooling, when it arrives at a temperature near the melting-point of lead, crystals will begin to form, which sink to the bottom, leaving the still fluid portion much richer in silver than the whole mass originally was, while, on the contrary, the crystallized portion has become poorer.

Church Hist. (PL): A Manichean sect of Asiatic origin, who appeared in Armenia in the seventh century. They owed their name to a mythical founder, or to their claim to "a monopoly of the pure doctrine of the Apostle of the Gentiles" (*Blunt*). From the close of the seventh to the middle of the ninth century, they suffered severe persecution, not only under the regency of Theodora (841-857), who did her best to exterminate them, no less than 100,000 are said to have perished from her attempts to carry out her design. *Blunt (Hist. Sects)* thus summarises their doctrines:

"They taught the essential evil of matter, the eternal hostility of the two principles, they denied the inspiration of the Old Testament and the Deity of Jehovah; they despised the Cross, and, holding the Valentinian doctrine that the spiritual Christ passed through the body of the Virgin like water through a pipe, were naturally accused of insulting her memory; they taught a purely illusory baptism, and had no Eucharist; they excluded their members from services from all government in their community; above all they were iconoclasts, and placed the Scriptures in the hands of the laity."

Pauline epistles, s. pl.

New Test. Canon: Fourteen epistles of the New Testament, thirteen of which commence with St. Paul's name, the fourteenth opening abruptly without any intimation as to the writer, though the detached title "The Epistle of Paul," has been prefixed to it. Its author was more probably Apollon than Paul. [HEBREWS.] Of the other thirteen, five (Romans, Ephesians, 1 and 2 Timothy, and Titus) have only St. Paul's name attached; four (2 Corinthians, Philippians, Colossians, and Philemon) are from Paul and Timothy; two (1 and 2 Thess.) are from Paul, Silvanus, and Timothy; one (1 Cor.) from Paul and Sosthenes, and one (Galatians) from Paul and "all the brethren that are with me." Their order of publication may have been: 1 and 2 Thessalonians on Paul's second missionary journey; Galatians, Romans, and 1 and 2 Corinthians, on his third; Philemon, Colossians, Ephesians, and Philippians during his imprisonment at Rome. The dates of the first epistle to Timothy and of that to Titus are somewhat doubtful; the second to Timothy was just before the Apostle's martyrdom. For details see the several epistles. Baur admits the genuineness of four, viz., Romans, 1 Corinthians, 2 Corinthians, and Galatians; but most critics believe the others also to have been the work of the great Apostle.

Pauline theology, s.

Script. & Theol.: The teaching of St. Paul as gathered from his sermons and addresses briefly reported in the Acts of the Apostles, and his Epistles. [PAULINE EPISTLES.] He gives prominence to the doctrine of justification by faith without the deeds of the law (Acts xiii, 9; Rom. iii, 19-31; iv, 1-25; v, 1; Gal. ii, 16; in. 8, 24, &c.). But he so states the doctrine as not to encourage sin (Rom vi, 1-23), and of the three Christian graces he assigns the pre-eminence to love, rendered in the A. V. charity (1 Cor. xiii, 13). The Apostle of the Gentiles, he contends against numerous gainsayers that the middle wall of partition between the Jews and the Gentiles is broken down, both now standing on the same footing as brethren in Christ (Rom. iii, 29; Ephes. ii, 11-22; iii, 1-11; Col. i, 21, 22; in. 11). But he speaks of his countrymen with the tenderest affection (Rom. ix, 1-5). The ceremonies of the older economy he regarded as but temporary, and as standing to Christ and the newer one in the relation of a shadow to substance (Col. ii, 16, 17). These broad views rendered the Apostle an object of suspicion to the Hebrew converts (Acts xvi, 20-21), and excited the most deadly animosity against him on the part of the unbelieving Jews (Acts xxi, 21, 22). Baur and others of the Helgen school consider that St. Paul, in emancipating himself from the Jewish prejudices in which the other apostles were entangled, became the real founder of

Christianity as a universal religion; but Prof. Otto Pfleiderer, of Berlin, in the Hibbert Lectures for 1887, repeated this extreme view, and considered Pauline Christianity as a genuine development of the teaching of Jesus.

To obviate possible danger from this custom, the Apostolic Constitutions strictly decreed the separation of the sexes at public worship. The pax was given at mass in the Western Churches till the thirteenth century, when Archbishop Walter of York in 1250 introduced the metal pax (2), and its use spread to the Continent. The pax is now only given at high masses, and the formal embrace substituted for the kiss is confined to those in the sanctuary.

A. As substantive:

1. *Ornithology*: (1) *Sing.*: Any individual of the genus *Pavo* (q.v.) specif., the common peacock (*Pavo cristatus*), a native of India, domesticated in Britain. The plumage is extremely gorgeous. Head, neck, and breast rich purple, with gold and green reflections; back green, feathers scale-like, with coppery edges; wings, inner coverts, and shoulders, white, striped with black; middle coverts deep blue primaries and tail (crestnut, abdomen black; train chiefly green, beautifully ocellated. of tail about four feet, and the train measures about as much more. Length thirty-eight to forty inches; crest shorter and duller than in the male. (*Ordon.*) Among the Greeks the peacock was sacred to Hera, and among the Romans to Juno. By the epicures of the Italian peninsula its flesh was esteemed a dainty (*Juvenal*, l. 113). "Quintus Hortensius (born 119 B.C.) was the first to serve up peacocks at table, at the supper which he gave on entering on the office of augur." (*Ancient*; *Satur.*, m. 13.) "The peacock during the courtship season raises his tail vertically, and with it, of course, the lengthened train, spreading it out, and strutting about to captivate the hen-birds; and he has the power of clattering the feathers in a most curious manner." — *Seiden Birds of India*, n. I. Ordinary Language:

1. In the same sense as II. 1.

2. *Figuratively*:

II. Technically:

1. *Zool. & Jewel*: A small, generally globular, spheroidal or hemispheroidal body of nacreous lustre, and composed of compact and free nacre, found as a morbid growth in many shells. The best are from the pearl-oyster or oriental pearl-mussel [PEARL-OYSTER], *Arcaula margaritifera*; others are from the British river mussel (*Unio margaritiferus*); the Common oyster, *Ostrea edulis*, from *Auaton cyanea*, *Pincta nobilis*, the Common Mussel (*Mytilus edulis*), and from *Spondylus gerdanus*, *Argo Navis*, and *Anomia cyra*. The pearls in many of these species are white; in the *Spondylus* they are green or rose-colored; in *Argo Navis* violet, and in *Anomia cyra* purple. Pearls have three layers like the shells, but the innermost layer of the shell becomes the outermost in the pearl. Dark lines add to the lustrous effect. The nucleus was formerly conjectured to be sand, but it is now found to be, as a rule, a fragment of brownish-yellow organic substance consisting of the bodies or eggs of internal parasites. Spherical pearls are not formed in the shell, but loose in the soft parts of the mollusc. Foreign substances introduced under the epidermis of the shell are coated with the lustrous substance. The Chinese take this means of obtaining lustrous bodies of various forms. A pearl belonging to Mr. Hope, said to be the largest known, is two inches long, four round, and weighs 1,800 grains. A pearl five-eighths of an inch in diameter was sold in London in 1860 for £2,000. The value of a pearl depends upon its size, shape, colour, brightness, and freedom from defects.

From some banks certain coves the oysters disappear from their beds at times for years together. The Dutch fishery failed entirely in the years 1792-46 and 1768-96. The years 1820-5, 1855-4, and 1864-75 were also unproductive. In 1797 and 1798 the Government sold the right of fishing the beds for £123,982 and £112,750 respectively; but since the fishery has been carried on by the Government the receipts have never exceeded £87,000 in any one year, and have fallen as low as £7,200, the net revenue for the fishery of 1864. Of late years private enterprise has been directed to the South Pacific as a pearling ground, and a fleet of decked boats and schooners is now employed in those waters by pearl-merchants.

*pēc cant lý, adv. [Eng. *peccant*; -ly.] In a peccant manner; sinfully; by transgression.

*pēc-ca rý, s. [Native name.]

Zool.: The popular name for two species of small shufline mammals from the New World, so nearly allied that they breed freely in captivity, but never produce more than two at a birth. The Collared Peccary (*Dicotyles torquatus*) ranges from Arkansas southward to the Rio Negro, and seldom attacks other animals. The White-tipped Peccary (*D. labialis*) is rarely met with north of British Honduras, or south of Paraguay. It associates in large droves, is very pugnacious, and does not hesitate to attack man. The hunter who encounters a herd of this species has often to take to a tree for safety. Both are omnivorous, and possess a gland in the middle of the back, secreting a musky substance, which taunts the meat if not speedily removed after death. By some old travellers this gland was mistaken for a second navel, a circumstance which influenced Cuvier in selecting the generic name.

Church Hist. & Ecclesiastical:

A. *As adj.*: Of or belonging to Pelagius [B].

B. *As subst.* (*Pl.*): The followers of Pelagius, a monk, probably of Welsh origin, first in high repute for genius, learning, and piety, who, going to Rome about A.D. 400, preceded, some five years later, to promulgate new views regarding original sin (*q.v.*) and free-grace (*q.v.*). He was the great opponent of St. Augustine, but there are two reasons why the teaching of Pelagius cannot be exactly ascertained: (1) It is gathered chiefly from the writings of his adversaries; (2) he was willing to adopt orthodox language, provided he might interpret it in his own fashion. Blunt (*Diet. Sects*, pp. 418-20) enumerates the following as his chief errors:

1. The denial of original sin, and, as a necessary consequence, its remission in baptism.
2. The denial of the necessity of grace.
3. The assertion of complete free will.
4. The possibility of a perfectly sinless man.
5. The existence of a middle state for infants dying unbaptized.
6. That Adam's fall injured himself only, and not his posterity.
7. That neither death nor sin passed upon all men by the fall of Adam.

His views were shared by an associate of his, another monk, Celestius, apparently an Irish-

man. Celestius was condemned for heresy in 412 by the Council of Carthage, and in 415 by a synod at Rome, and was banished by the emperor. He was again condemned by a synod at Rome in 430, and by the Council of Ephesus in 431. It is uncertain when he died. The controversy went on in a languishing manner till the seventh century. [SEMI-PELAGIAN.]

"Whilst the *Pelagian* never existed as a sect separate from the Church of *Antioch*, yet wherever *Antioch* has infected any part of the Church, there Pelagianism has sooner or later appeared; and the term Pelagian has been continued to denote those which imitate the effects of the Fall, and make man's nature's natural ability." — *Enges. 1. (*Ornith.*): Any bird of the genus *Pelecanus* (*q.v.*), and especially the Common Pelican, the *Cathartes* of the Greeks and Romans, and the *Pelecanus onocrotalus* of modern science. Pelicans are large piscivorous water-birds, with an enormous pouch, dependent from the flexible branches of the lower mandible, the use of which being contracted for food, not in use as a depository for food. The Common Pelican is about the size of a swan, though its enormous bill and loose-plumaged neck look considerably larger; it is white, slightly tinged with flesh-color, and the breast feathers become yellow in old birds. It usually nests on the ground, in some re-

tired spot near the water, and lays two or three white eggs. The pelican sits during the night with its bill resting on its breast; and, as the hook at the extremity of the bill is red, this may have given rise to the legend that the bird feeds its young with blood from its own breast [6], though it is possible that the story has some foundation in fact. It is well known that the males of many species assiduously feed the females during incubation; and in 1809 the flame-colored in the Zoological Gardens were observed to sport into the mouth of the Canaries, apparently in the belief that the latter were in want of food, a glutinous red fluid, which, on microscopic examination, was found to consist almost entirely of blood-corpuscles. Mr. Bartlett, who reports the circumstance, says: "I have here an explanation of the old story of the pelican feeding its young with its own blood? I think we have; for the flame-colored was, and is still, found plentifully in the country alluded to; and it may be that in the translation the habit of the one bird has been transferred to the other." (*Proc. Zool. Soc.*, 1809, p. 146.)

"Two specimens of the famous *asomus pelicanus* have been found in the English fens (1858, 1860, p. 205, *Proc. Zool. Soc.*, 1857, p. 502), thus proving the former existence of the bird in England at no very distant period, and one of them being that of a young example, probably having been bred in this country. It is possible from their large size that they belonged to *Pelecanus longirostris* (not *albo*, xxiii. 454.)

2. (*Script.*): **788.** (*apēllō*), from a verb in the cognate languages = to vomit, seems to be the pelican (Lev. xi. 18, Deut. xiv. 17, Psalm cv. 6). In the A.V. it is mistranslated *carabur*, in Isa. xxxv. 11 and Zeph. i. 14, the R.V. restoring uniformity by rendering it *pelican*.

6. (*Art.*): The pelican is the symbol of charity. It is generally represented wounding its breast to feed its young with its own blood — a tale told in the fabulous natural history of the middle ages, and which made the bird the adopted symbol of the Redeemer. When so represented the pelican is said to be "in her piety." In emeralds the lancers at the foot and the pelican at the top of the cross.

"(1) When the Reformation struggle terminated by the supremacy of Protestantism, the Roman Catholics both in England and Ireland were put under serious disabilities. Till 1800 the latter country had a parliament of its own, from which, except during the short revolution effected by James II., Roman Catholics were excluded, as they were also from all important offices in the State. The Irish Protestant Parliament was systematically unjust to the Roman Catholics, though they constituted a large majority of the nation. At the Reformation the endowments had been transferred to the Protestant minority, and when, in 1800, the Irish Parliament ceased, the Protestant church was merged with that of England, under the title of the United Church of England and Ireland. The English Roman Catholics had been excluded from corporate offices in 1667, from the throne in 1689, and from parliament in 1691. The first great step towards the relief of their disabilities was the Catholic Emancipation Act, passed April 19, 1823, which re-introduced them to parliament and to important offices. On January 1, 1871, the portion of the United Church of England and Ireland in the latter island was disestablished and disendowed. The Ecclesiastical Titles Bill, which had been passed during a panic in August, 1851, and found inoperative, was repealed on July 24, 1871. Public opinion is now increasingly in favour of sweeping every penal law directed against any religion wholly away.

2. The outward acts by which sorrow for sin is evinced.

3. The satisfaction which a priest imposes on the penitent before giving absolution, often called sacramental penance. [PENITENTIAL-DISCIPLINE.]

4. A sacrament of the New Law, whereby sins, whether mortal or venial, committed after baptism are forgiven. The Council of Trent (sess. xiv., c. iii.) defines that the form of the sacrament consists in the words, "Ego te absolvo," &c., the "quasi materia" in the acts of the penitent—contrition, confession, and satisfaction. The minister of the sacrament is a priest with ordinary or delegated power to absolve, and the subjects those who have received baptism. It is not of obligation to confess venial sins, but mortal sins committed after baptism must be confessed. Roman theologians rely on the words of Jesus (John xx. 23) as proving the divine institution of the sacrament of penance. The dispositions and acts necessary on the part of the penitent are a hearty sorrow for sin, because it is an offence against God, joined with a firm purpose of amendment, the confession of sins to a priest approved by the bishop, and the performance of the penance imposed by him.

¶ *Tribunal of Penance*: The confessional.

Penarth beds, s. pl. A series of beds of varying Penarth House and Llawerok Point, near Cardiff. They are intermediate between the Triassic and the Jurassic beds. The base usually consists of a set of gray, green, cream-coloured, and pale green marls called Tea-green Marls, sensibly passing up into dark shales full of fossils, the whole about fifty feet thick. In 1871, Colonel Peacock found similar beds in the North of Ireland full of *Ammonoites* and *Belemnites*. He called them the *Penarth zone*, and considered them to be Liassic, but the fossils are more closely akin to the Trias, and the beds are ranked by Lyell and Etheridge as Upper Trias. The series was traced largely in the Rhoetan Alps, and was called by Gumbel, Rhætic. It has relations with the Kossener Schichten of the Tyrol and the Upper St. Cassian beds of Germany. The term Penarth beds was given by the Government surveyors. Etheridge would prefer Rhætic. The genera Ichthyosaurus and Plesiosaurus commence in these beds, which contain also Microlepis (q.v.).

Composit. Ital. words. The Roman gods of the store-room and kitchen. The family hearth, which formerly stood in the atrium, was their altar, and on it their images, two in number, were placed, with the image of the Lar between them. These Penates were represented dancing and elevating a drinking-horn in token of joy and plenty. The Calends, Nones, and Ides of each month were set apart for their worship, as were the Caristia (Feb. 22) and the Saturnalia (q.v.). Each family had its own Penates, and the State had its public Penates. The worship of these gods was closely connected with that of Vesta (*Composit. de Not. Dion.*, ii. 27), in whose temple the public Penates were at one time worshipped, though they had a temple of their own near the Forum. It is possible that the former may have been the Penates of Latium, while the latter may have been the Penates of the city. The origin of these gods is extremely doubtful. According to ancient tradition they were first worshipped in Samothrace, whence brought to Troy, and Virgil (*Æneid*, i. 48) makes Æneas the means of their introduction into Italy. As was the case with the Lares, their name was a synonym for home (*Composit. de Carm.*, iii. 27, 39; cf. *Carm. Sc.*, 330).

*The pen *Penates*, a simple gods of food, are probably much more ancient than deities like Jupiter, Neptune, Apollo and Minerva, whose wide and varied attributes represent a power of abstraction and generalization on the names of their worshippers such as is not possessed by very primitive men. — *Æneid. Brit.*, ii. 16, 17, 18.

II. Technically:

1. *Mech.*: A simple pendulum is a heavy particle suspended by a fine thread from a fixed point, about which it oscillates without friction. The time of its vibration is directly as the square root of the length, and inversely as the square root of the accelerating force of gravity. The length of the arc through which it vibrates does not affect the result. No simple pendulum can exist; all constructed by man are compound pendulums in which there gravitates, not a particle, but a heavy body called the bob, the law of friction of course operating.

2. *Horology:*

(1) The ordinary pendulum is believed to have been the invention of Eln Junis of the university of Corlova about A.D. 1100, his companion, Gerbert (poisoned in 1102), making the first escapement. Henry de Wyck (1364), Harris (1641), and Huyghens (about 1657) applied it to clocks, Galileo, in 1581, having recommended a pendulous weight as a true measurer, and Santoritis, in 1612, the combination of a pendulum with wheel-work. Pendulums generally move in arcs of circles. In the cycloidal pendulum the rod of suspension describes the arc of a cycloid, and in the conical a cone. Heat lengthens, and cold contracts the rod of a pendulum, it is of a single metal. To neutralize these effects compensation pendulums are made; the gridiron pendulum having bars of iron and steel to work against each other, and the mercurial pendulum making the centre of the oscillation of the bob uniform by the expansion and contraction of mercury inside. The curved line along which the bob of a pendulum moves is called the arc of vibration, the horizontal chord of that arc the axis of oscillation, and the point around which the pendulum moves the point of suspension, or the centre of motion. The length of a pendulum vibrating seconds is directly proportionate to the force of gravity at the place. One constructed to beat seconds at London (lat. of Greenwich Observatory, 51° 28' N.) at the sea-level must measure 39.13983 inches; at the Equator, 39.02074 inches; and at Spitzbergen, 39.21169 inches. To regulate a clock by means of a pendulum, the rod of the latter is made to pass between the prongs of a fork, and thus communicate its motion to a rod oscillating on a horizontal axis. To this axis is fixed a piece called an escapement, or crutch, terminated by two projections named pallets, which work alternately with the teeth of the escapement wheel. As the pendulum moves, the one crutch is raised, allowing the wheel to escape from the control of the pallet, the weight then descends, till arrested and made to re-ascend by the action of the other pallet. The motion of the escapement is communi-

cated by additional mechanism to the hands of the clock, which are thus regulated by the pendulum.

Script. Canon. : A term applied exclusively to the first five books of the Old Testament collectively, termed in Hebrew חומש (Chumash) = the Law. The first mention of the five-fold division is by Josephus. It seems to have been made by the Septuagint translators, who then bestowed on the volume a Greek name expressive of what they had done, [Elym.] In its undivided state it is called in Ezra viii. 6, "the Law of Moses;" in Neh. xiii. 1, "the Book of the Law of Moses;" and, more simply, in 2 Chron. xxxv. 4, xxxv. 12, Ezra vi. 18, Neh. xiii. 1, "the Book of Moses." It is the "Book of the Law of the Lord" (Chabrah) in 2 Chron. xiii. 3. Either the Pentateuch or the book of Deuteronomy is the "Book of the Covenant" in 2 Kings xxiii. 2, 21, and "the Book of the Law" in xxiii. 8.

The titles in both the A.V. and the R.V. of the Bible, following the Septuagint, attribute the five books to Moses. The Hebrew text prefixes his name only to Deuteronomy (Deut. i. 1), and to portions of the others (Exod. xvii. 14, xxiv. 3, 4, xxxiv. 27). No critic attributes Deut. xxvii. 5 to Moses. Some other passages seem of later date, Gen. xii. 6, xiv. 14 (cf. with Judges xviii. 20), Gen. xxxvi. 34, Lev. xviii. 28, Deut. iii. 11, &c.; others, such as modesty would have prevented Moses from writing (Exod. xi. 3, Num. xii. 3). These are often attributed to Ezra. Except the author of the Clementine Homilies, who disbelieved, and Jerome, who doubted it, the Mosaic authorship of the Pentateuch seems to have been universally accepted by the early Christians. In 1167 Aben Ezra expressed his doubts, as did Hobbes in 1651. Astruc, in 1753, published the hypothesis of different documents proved by the diversity in the Divine names employed [Elohist, Jehovist], a view now accepted by most critics. Since then there have been the Fragmentary Hypothesis of Vater & Hartmann (1815-1818), by which the book is supposed to be made up of fragments put together, and the supplementary Hypothesis of De Wette, and many more. Hengstenberg is the chief opponent of Astruc's hypothesis, considering that the name God is used when creation is referred to, and Jehovah when there is redemption. Between 1862 and 1871 Bishop Colenso, of Natal, published a critical commentary on the Pentateuch, denying the Mosaic authorship of the book, and attributing the Levitical regulations to the priesthood during and after the Babylonian captivity (b.c. 600-450). These views created great excitement. They were controverted in many pamphlets, and led to the ecclesiastical prosecution of their author. [GENESIS, EXODUS.]

Script. : The Pentateuch in use among the Samaritans. Words which have in them *d* and *e*, and again, *i* and *e*, letters unlike in the Samaritan, but very similar in Hebrew [ד (d) and ע (e), also י (i) and ו (v)], are sometimes interchanged, showing that the work was derived from a Hebrew original. The passages attributed to Ezra are in it. It substitutes Mount Gerizim for Mount Ebal in Deut. xxvii. 4. The text in various places differs from the Hebrew, generally, however, agreeing with the Septuagint. The chronology also is in places at variance with that of the Hebrew Bible. If Josephus is correct as to the date of the building of the Temple on Mount Gerizim, the Samaritan Pentateuch was made probably about 330 b.c., though the popular belief is that it is much older.

1. *Trinitarian*: One of the three greatest Jewish festivals. Its Greek name was given because it was held on the fiftieth day (lit. ann.) counting from the second of the Passover (Lev. xxiii. 15, 16), when it was called in Hebrew the Feast of Weeks (Levit. xvi. 9, 10). By this account the enumeration of the weeks was to put the sickle to the corn. It was called also the Feast of Harvest, or Fiftieth of Wheat Harvest (Exod. xxiii. 16; xxiii. 22). When it came every Jewish male had to present himself before Jehovah (Exod. xxiii. 17; xxiii. 23). Meat or wave offerings, especially two wave loaves, and sacrifices were presented at the festival (Lev. xxiii. 16, 17, &c.; Num. xxviii. 26-29; Levit. vii. 9-12). The Holy Spirit descended on the members of the infant Christian church on the day of Pentecost, imparting the gift of tongues (Acts ii. 1-20). In ancient times the Pentecost lasted but a single day, but modern Judaism extends it to two.

Optics: A faint shadow thrown by a luminous body. It is brighter than the true shadow, though less so than the luminous body itself. It is a modification of the true shadow produced by the commingling with it of rays emitted by a portion of the luminous body. In an eclipse of the moon, the rays which have just grazed the edge of the earth are bent inwards by the refraction of the atmosphere, besides having become tinged with a ruddy or copper hue. Falling upon the moon, then in shadow, they often render it faintly visible, and though of a copper hue, yet bright enough to permit markings on its surface to be seen. Yet at this time the moon is so much behind the earth that it cannot be reached by any direct rays from the sun. In an eclipse the periods when the first and the last contact with the penumbra will take place are always carefully noted.

The ground peppers of commerce are generally mixtures of different kinds of berries; e.g., Malabar is used to give weight, Penang or Trang to give strength, and Sumatra to give colour. Pepper contains an alkaloid [PIPERINE], a volatile oil, an acrid resin, together with starch, gum, albumin, &c. The ash in ground black pepper should not

exceed 5 per cent., in white pepper 3 per cent. Pepper has been adulterated, more or less, for the last 200 years, the adulterants being rice and rice-husks, linseed meal, mustard husks, wheat flour, sago flour, ground date and olive stones, bone-dust, chalk, P. II. *Metaph.*: The reception of knowledge through the senses, and the faculty by which knowledge is so received, and communication maintained between the subject and the external world. Perception differs from conception, in dealing with things that have an actual, not merely a possible existence, and from consciousness, in that it is concerned with objects external to the mind of the perceiver. It is, in brief, the taking cognizance of impressions received by the senses.

The word *Perception* is, in the language of philosophy, previously to being used in a very extensive signification. By Descartes, Malebranche, Locke, Leibniz, and others it is employed in a sense almost synonymous with a consciousness in its widest extension. By Reid of this word was limited to its ordinary appropriate of knowledge, and to that branch of it for which, through the senses, we obtain a knowledge of the external world. But his limitation did not stop here. In the act of external perception, he distinguished two elements, to which he gave the name of *Perception* and *Sensation*. He called, perhaps, proper, when employed in its special meaning, for, in the language of other philosophers, *Sensation* was a term which included *Perception*, and *Perception* a term which included his *Sensation*.—*Hamilton's Metaphysics*, Mackenzie, n. 2.

II. *Philos.* (*Pl.*): The name given to the followers of the Aristotelian philosophy. Aristotle, partly adopted the results of Plato, and made them available for the world, partly he dissented from the Platonic doctrines and carried on war against them. Both parties admitted that science could only be formed from Universals, but Aristotle took the view afterwards called Nominalist (q.v.), and contended that such Universals were nothing more than inductions from particular facts. He thus made experience the basis of all Science. In the middle ages, Albertus Magnus (1223-1280) did much to spread the Peripatetic philosophy, as well as the ethical and physical writings of Aristotle, and his pupil, St. Thomas Aquinas (1227-1274), the greatest of the Scholastics, was much influenced by them. The study of the works of Aristotle has been greatly revived in the present century, and those of St. Thomas Aquinas have been specially recommended to clerical students by Pope Leo XIII.

A. 1. *adj.* *substantive*: 1. Of or belonging to Perm, a province of Russia, divided into two parts by the Ural Mountains.

2. Of or belonging to the rocks described under B.

B. 1. *adj.* *substantive*: 1. The name given by Sir Roderick Murchison in Oct. 1841, to a series of strata previously noted upon as the base of the New Red Sandstone, but which have greater affinity to the carboniferous deposits. The two strata are now classified apart, and it is generally held that between them runs the great boundary separating the Paleozoic from the Secondary strata. Mr. Hill thus divides the English Permian strata

N.W. N.E. of Eng. of Eng. Feet thick.

Lower Permian	Red and Variegated	100-150	100-250
Middle Permian	Blue and Green	100-150	100-250
Upper Permian	Red sandstone and shales	10-50	100

The Lower Permian consists of the Permian sandstone. The Labyrinthine footprints in Corncockle Quarry, near Dumfries, were of this age. There are also angular breccias, attributed by Sir Andrew Ramsay to the action of floating ice. The Middle Permian is best seen upon the coast of Durham and Yorkshire, between the Wear and the Tyne. [MAGNETAN-LAND STONE.] The Upper Permian attains its chief thickness at St. Bos's Head, in Cumberland. In Germany two types of strata, a Rothliegendes and a Zechstein group, exist in the Permian, hence called by us to v.l. In Russia the Permian rocks occupy an area twice the size of France. The Permian rocks contain a fauna and flora of 110 genera and 225 species, viz. plants, 18 genera and 26 species. Among animal remains are Echinodermata, 2 genera and 2 species; Crustacea, 4 genera and 20 species; Brachiopoda, 15 genera and 35 species; Conchifera, 20 genera and 37 species; Gastropoda, 11 genera and 25 species; Cephalopoda, 1 genera and 1 species; Fishes, 11 genera and 26 species; Reptiles, 9 genera and 17 species. No birds or mammals. [Eldredge.] Among the plants are Psaronius, among the fishes, Palaeoniscus, and among the reptiles, Proteroniscus (q.v.); the former are but few compared with those of the immediately preceding Carboniferous system. Mr. Eldredge believes that the Permian rocks in general were deposited in isolated basins, probably of fresh water, which underwent extreme concentration and chemical precipitation. Some salt springs rise in or through the formations. There are traces of extinct Permian volcanoes in Dumfries and Ayrshire. The former are in the northern half of the Thornhill basin, where there exists a series of interstratified beds of porphyritic and lavas associated with beds of tuff. In the latter county rocks of volcanic agglomerates, marking the sites of extinct volcanoes, are S.E. of Lymington, east of Irvine, near Stevenston, &c. [Seely.]

perpendicular style.

Arch.: The third period of Painted Architecture. It originated at the end of the fourteenth century, and continued until the close of the sixteenth, when it was succeeded by the Revival, or Debased Classic, known as the Elizabethan. It is also known as the Flood, from the multiplicity, profusion, and minuteness of ornamental detail, and its more

general name, Perpendicular, is derived from the nullions of the windows and the divisions of ornamental panel-work running in straight or perpendicular lines, which was not the case in any earlier style.

The pointed arches are constructed from almost every radius. The most common doorway is the depressed four-centred arch (almost peculiar to this style) with a square head, having generally a hood-moulding over, the spandrels being filled with quadrifolds, penning, roses, foliage, small shields, or other sculptured ornaments. Fan shaped roofs, ornamented with dependent pendants resembling stalactites, are also peculiar to the Perpendicular style. Richly decorated roof-trusses, which are left clearly visible, are also of frequent occurrence. In these roofs the spaces between the highly ornamented and moulded beams

are filled with rich tracery, whilst the intersections and junctions of the woodwork are enriched with dependent carving and representations of foliage and figures. Westminster Hall is an instance of this description of roof. The roofs, when they are plain, are sometimes overlaid with boarding, and divided by ribs and panels.

1. A motion, which, once generated by mechanical means, should have the power of perpetuating itself.

"As the result of the vain search after the perpetual motion there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy."—*Engels*, *Brit. and For.*, xviii, 325.

2. A machine, which, according to the hopes of its inventors, after it has been once set in motion, will go on doing useful work, without drawing on any external source of energy. Such a machine would entirely controvert the established principle of the conservation of energy, and since the establishment of that principle the search for a perpetual motion has been judged visionary. So early as 1775 the Academie des Sciences of Paris placed the problem in the same category with the duplication of the cube and the quadrature of the circle, and refused to receive schemes claiming to have overcome the difficulty—in reality, to have performed the impossible. The overbalancing wheel was a favourite contrivance with the seekers after a perpetual motion. It appears as early as the thirteenth century, and was adopted by the Marquis of Worcester (*Cent. Inventions*, art. 56) and by Orflyous. Perpetual motions have been founded on the hydrostatic paradox, on capillary attraction, on electricity and magnetism, but in every case the result has been the same. (The subject has been fully treated by Mr. Henry Dicks, in his *Perpetua Mobile*.)

"Briefly, a perpetual motion usually means a machine which will create energy."—*Engels*, *Brit. and For.*, xviii, 325.

3. A carrying on, prosecution. (*Abol.*)

* The word first became current in Christian circles in connection with ten persecutions of Christians under the Roman emperors. The first was the persecution under Nero, A.D. 64; the second, that under Domitian, A.D. 91; the third, that under Trajan, A.D. 106; the fourth, that under M. Aurelius, A.D. 160; the fifth, that under Septimius Severus, A.D. 193; the sixth, that under Maximian I., A.D. 303; the seventh, that under Diocletian, A.D. 303; the eighth, that under Valerian, A.D. 258; the ninth, that under Aurelian, A.D. 272; and the tenth, that under Diocletian, A.D. 303. The arrangement is not perfect. If only persecutions general through the empire are counted, the number is fewer than ten; if local ones are taken into account, they are more numerous. When Christianity became dominant in portions of the Roman empire, it used the civil power for the overthrow of heathenism. The medieval church persecuted all whom it considered heretics, and the Reformation in England and elsewhere had to struggle against persecution. When it became powerful enough, it also became indifferent to those who differed from it, passing and carrying out penal laws against Roman Catholics, dissenters, and unbelievers. Whilst Great Britain and America have made great strides towards religious liberty, they are not as yet fully free from the spirit which prompts to persecution.

This is indicated in the etymology of the word. It is found when objects are so looked at that their apparent form is very different from their real one, both as regards shape and distinctness. The portion of the subject which deals with the changes in form is absolutely scientific; it is called Linear Perspective. The changes in distinctness are effected by distance and atmosphere, and differ constantly with different conditions of light and atmosphere. It is the purely artistic side of the science which is called Aerial Perspective, and success in its application depends upon the individual ability of the artist. The chief point with which Linear Perspective has to deal is the apparent diminution in size of objects as they recede from the spectator, a fact which any one can test by observing a long straight stretch of railway. The cross sleepers and the telegraph poles diminish in apparent size to the point of invisibility when they are far off on the horizon. It is the rules which govern such changes as these which are dealt with by Linear Perspective; while the fact that the same telegraph poles, black and brown and yellow when seen close, gradually put on a blue hazy colour as they become more distant is one of the facts dealt with by Aerial Perspective. A practical knowledge of the science is absolutely a necessity for a successful artist.

(4) *Perspective plane*: The surface upon which the objects are delineated, or the picture drawn. It is supposed to be placed vertically between the eye of the spectator and the object. Also termed the plane of projection, or the plane of the picture.

II. *Physiology*:
1. *Human*: Watery matter "breathed out," or made to expire from the system by means of the pores in the skin. It is more copious than the matter sent forth from the lungs by respiration, averaging eleven grains per minute against seven from the lungs. The quantity varies greatly, and is affected by the amount of heat or dryness in the atmosphere, by the fluid drunk, by the exercise taken, by the relative activity of the kidneys, by medicine, &c. The relative proportions of sensible and insensible perspiration also vary; and sometimes, when, seeing drops on our skin, we believe that we are perspiring copiously, the increase is chiefly in the sensible kind, not in the total amount. Less than two per cent. of solid matter is contained in the watery vapour. The chief ingredients are: sodium chloride, formic, acetic, butyric, and perhaps propionic, caproic, and caprylic acids; neutral fats, cholesterine, nitrogen, &c. In acute Bright's disease urea is also present, and imparts a urinous odour to the vapour passing off from the system. Besides keeping the skin in a healthy, moist condition, and acting as a refrigerator, perspiration takes its share in carrying off superfluous or noxious matter from the system. If stopped, morbid consequences are sure, sooner or later, to ensue.

I. Ital. Lang.: That mental attitude which induces one to give preponderating importance to the evils and sorrows of existence; the habit of taking a gloomy and desponding view of things.
II. Hist. & Philos.: The name given to the system of philosophy enounced by Schopenhauer (1788-1860) in Die Welt als Wille und Vorstellung (of which the first volume was published in 1819, and the second some five-and-twenty years after), and by Von Hartmann in his Philosophie des Unbewussten (1860), though the feelings to which these writers gave utterance had previously a wide range both in time and space. The belief that "the times are very evil" has found expression in almost every philosophic and religious system at one period or other of its existence. But it was at the beginning of this century that Pessimism began to create a literature of its own, and to impart a sombre hue to the writings of men not avowedly its disciples. As examples may be cited Byron's Ethionissa and Heine's Fragen. The adherents of this philosophy have for the most part belonged to the German races, Leopardi (1798-1837) being the sole Latin writer of note who has advocated pessimist theories. (For an account of Schopenhauer and his writings, see his Life, by Miss Zimmer.)

"In their special and technical employment, optimism and pessimism denote specific theories elaborated by philosophers - the latter [to show] that existence, when summed up, has an enormous surplus of pain over pleasure, and that man in particular, recognizing this fact, can find real good only in abnegation and self-sacrifice." - Engr. Pēs-talōzz' -i-an-ism (zz as tz), s. [Eng. Pestalozzian; -ism.]
Hist. & Education: The system of education introduced by Pestalozzi. It brought no new principle to bear upon the subject, but put in practice one already established, that education is rather a developing of the faculties than an imparting of knowledge. In his book, How Gertrude teaches her children, Pestalozzi lays down the following dicta:—

- 1. Demonstration is the foundation of teaching.
2. Instruction should begin with the simplest elements, advancing step by step to the more difficult.
3. The lesson should be mastered before attempting a second.
4. The true end of education to be kept in view.
5. The relation between teacher and scholar should be that of love.

To Pestalozzi is due the introduction of object-lessons; and Frobel, the founder of the Kindergarten system, who was one of Pestalozzi's pupils, probably obtained the first germs of his own method from his early preceptor.

II. New Test. Biog.: The Greek surname of an apostle of Jesus. It is the rendering of the East Aramaean ܩܦܬܐ (*kēphā*), a corruption or derivation from Heb. ֶפֶז (*kēph*) = a rock (Job xxx. 6; Jer. iv. 29), and was given by Jesus (John i. 40-42). Translated into Greek, with a termination, it became *Κηφᾶς* (*Kēphās*) (Gal. ii. 9). Peter's real name was Simon (Matt. xvii. 25; Luke iv. 38, v. 3, 5, &c.), his father's Jonas (John xxi. 15), his brother's Andrew (Matt. iv. 18). Peter was born at Bethsaida (John i. 44), but had removed to Capernaum, where he had a house, being a married man (Matt. viii. 14; Mark i. 30; Luke iv. 38; 1 Cor. ix. 5). For his call to be an apostle, see Matt. iv. 18; Mark i. 16-18; Luke v. 1-11; John i. 35-42. Three of the twelve were selected on three occasions by Jesus for special honour (Mark v. 37; Matt. xvii. 1, xxvi. 37). Peter's name standing first, though John was the disciple whom Jesus loved (John xii. 26, xx. 2, xxi. 20, 24. [PILLAR-APOSTLES.]) The Power of the Keys was first bestowed on him (Matt. xvi. 13-20), though afterwards also on the other apostles (cf. xviii. 1 with 18). Peter was of an impulsive temperament, generous, but too forward in speech (xvi. 22, 23), and rash in action (John xviii. 10). It was not natural cowardice, but because through his rashness he had committed himself, and was in danger of arrest, that made him deny his Lord (Matt. xxvi. 51-75). After the Ascension, he was for a time the most prominent of the apostles (Acts i. 15, ii. 14, &c., iii. 1-26, iv. 8, 9, v. 1-16), and though specially sent to the Jews (Gal. ii. 8), yet had the privilege of being the first to admit Gentiles into the church

(Acts x. 1-18). Afterwards he was somewhat cast into the shade by the entrance of St. Paul, and on one occasion dissembling his liberal views when in narrow Judine company, was withstood by St. Paul to the face "because he was to be blamed" (Gal. ii. 11). Tradition makes him die as a martyr at Rome, about A.D. 64, crucified with his head downwards. Roman Catholics claim him as the first Bishop of Rome, and consider that the authority delegated him by Jesus appertains also to his successors, the Popes of Rome.

* (1) *The First Epistle General of Peter* :

New Test. Canon: An epistle which claims to have been written by the Apostle Peter (i. 1), apparently from Babylon (v. 13), "to the strangers scattered throughout Pontus, Galatia, Cappadocia, Asia, and Bithynia" (i. 1), all places in Asia Minor. These strangers were obviously Christian converts, the majority apparently Gentiles (ii. 14, ii. 19, iv. 3). Their churches were in charge of elders (v. 4). They were in suffering (i. 6), which the apostle foresaw would deepen into severe persecution (iv. 12-18). He exhorts them to steadfastness, to careful avoidance of crime and scandal (ii. 12, iv. 15), to humility (v. 5-6), and the proper observance of their duties of subjects, servants, husbands or wives, brethren in a natural or spiritual sense (ii. 13-iii. 8), office-bearers, or members in Christian churches (v. 1-5). The epistle was probably carried by Silvanus (v. 12). St. Mark seems to have been with Peter when it was written (v. 13). Its date is uncertain, probably between A.D. 60 and A.D. 64. There is strong evidence for its authenticity, which has rarely been doubted.

(2) *The Second Epistle of Peter* :

New Test. Canon: Another epistle claiming to have been penned by the Apostle (i. 1), the author also referring to the transfiguration scene as one which he personally witnessed (i. 17, 18), and to a previous epistle (iii. 1). In this second letter he seeks to establish Christians in the faith, warns them against false teachers, and predicts the general conflagration of the world. Its style is different from that of the first. The language and sentiments of ch. ii. and part of iii. resemble Jude. When it was published, the epistles of St. Paul had been collected, and formed part of New Testament Scripture (iii. 15-16). The evidence for its authenticity is much less strong than that for the first epistle. Clement of Alexandria seems to have known it. It is not in the Peschito (q.v.); Cyprian ignored it; Origen and Eusebius placed it among the controverted writings, but it gradually obtained acceptance before the close of the fourth century.

From being sent to Rome it was called by the Saxons *Rome-feoh*, *Rome-seot*, and *Rome-pennyng*. The name Peter-pence arose from its being collected on St. Peter's Day. From being levied on every private and every religious house, the Abbey of St. Albans only excepted, it was called also *Hearth-money*. At first it was used chiefly for the support of an English college at Rome, then the Pope shared the gift with the college, and finally appropriated the whole. Edward III. forbade its being paid; but it was soon restored. The Act 21 Henry VIII. c. 21, passed in 1534, swept it away.

Chem.: Earth oil, naphtha, mineral oil, paraffin oil. These liquids vary in colour from a faint yellow to a brownish-black, and in consistency from a thin transparent oil to a fluid as thick as treacle, and their specific gravities range from 7 to 11. They are found in abundance in Pennsylvania and other parts of the United States, and in Canada. Pelonze and Colours have shown that these oils consist mainly of homologues of marsh-gas, and they were able to isolate by fractional distillation twelve members of the series [PARAFFIN, I. (2)], gaseous, liquid, and semi-solid. A light petroleum oil is used all over the world for lubricating purposes, and a heavy oil for lubricating machinery. The former should, according to the Petroleum Act of 1871, have a sp. gr. 810 to 820, and should not evolve inflammable vapour until heated to 55°. If an oil gives off inflammable vapour below this temperature it is considered unsafe for domestic use. Paraffin oil is the commercial name for an oil obtained by direct distillation from American petroleum. It is also applied to an oil produced by the dry distillation of boghead coal, shale, &c., at a temperature considerably lower than that employed in the manufacture of gas.

pē-trōl-ō-gŷ, s. [Gr. πέτρος (petros) = a stone, a rock; suff. -ology.]

Nat. Science: The study of the mineralogical and chemical composition of rocks; including the various changes they have undergone through physical and chemical agencies, either combined or separate. Microscopic and macroscopic examination, together with chemical analysis, are the methods pursued. If the rock is of sufficiently coarse texture, an examination by an ordinary lens suffices, but in rocks of the grain a thin section is prepared, and, under the microscope, the individual mineral constituents are recognized by their specific structural and optical characters. The chemical analysis is performed either on the rock as a whole, or the mass is pulverised, and the mineral species of which it consists separated by certain fluid chemical compounds of known density, and the products of this separation separately analysed.

" He has included in his text-book an excellent outline of the present state of microscopic petrology. — Athenæum, Oct. 28, 1882.

The Gray Phalarope (*P. fulvicornis*) is so called from the prevailing hue of its winter plumage; in summer the upper parts exhibit a mixture of black, white, and yellow; breast and under parts reddish chestnut. Compar. Relig.: The worship of the fertilizing power of nature under the symbol of the phallus (q.v.). The idea that natural productions were engendered in a manner akin to the propagation of man and the lower animals is poetically expressed by Virgil (*Georg.* ii, 321-327) and Lucretius (i, 257, 599). Phallicism appears to have been at first an independent cult, but was afterwards adopted into other forms of worship, or it may have been the germ whence other forms sprang. Its origin is unknown. The Phœnicians ascribed its introduction into their worship to Adonis; the Egyptians to Osiris, the Phrygians to Atys, and the Greeks to Dionysos, but such a belief may well have arisen in many places in the infancy of the human race. [ASHFORTH, BVAL, BEL, GROVE, & H. I., LINGA, SERPENT-WORSHIP, YONI.]

II. Judaism (J): The most numerous of the three divisions or orders of Judaism in the time of Christ, the other two being the Essenes and the Sadducees. They were so called because they kept aloof from Levitically unpure food, separated themselves from the lawless people of the land, and aimed to keep the Mosaic law in accordance with Ezra vi. 21, ix. 1, x. 11; Neh. ix. 2, x. 28. They arose immediately after the return from the Babylonian captivity. As all the students of the law naturally joined this association, the appellation Member, Associate, חַבֵּר (chaber), or Pharisee, פְּרִישִׁי (parishi), became synonymous with student, disciple, lawyer, scribe. Accordingly, they represented the national faith of orthodox Judaism. Having to expound, to adapt to the vicissitudes of the commonwealth, and to administer such an extensive and gorgeous ritual as that of the Mosaic law, some of the Pharisees fell into extravagances, and laid more stress on trifling and petty formulae than on the spirit of the law. Hence, the Rabbin itself divides the Pharisees into seven kinds: (1) (D) The shoulder Pharisee, who carries, as it were, his good works on his shoulders to boast of them openly, and is weighed down by his innumerable virtues; (2) the time-wasting Pharisee, who, when you ask for anything, always says, 'Let me go first to do a goodly work;' (3) the seducting Pharisee, who says, 'Deduct from my many virtues the few vice I commit;' (4) the saving Pharisee, who says, 'I save from my small means to be able to spend it on good works;' (5) the Pharisee who says, 'Would that I knew what sin I committed that I might atone for it by doing a good work;' (6) the land-floating Pharisee, and (7) the God-loving Pharisee (Jerusalem Berachot, ix. 14; Babylon Seta, 22 b), the last two of which alone are to be commended." It is the first five kinds to whom the rebukes of Christ refer, and who have given rise to the term Pharisee being used as synonymous with a strict observer of external forms of religion without the spirit of it. Hist. of Education: The name given to a school founded at Dessau, in 1774, by J. H. Basedow (1723-90), or to any school conducted on similar principles. The object was to give children an education founded on philanthropy, cosmopolitanism, and natural religion. Every boy was taught a handicraft. Of the twenty-four hours eight were allotted to sleep, eight to meals and recreation, and of the remaining eight the children of the rich were to study six and give two to manual labour, the proportions being reversed in the case of the children of the poor. Great results were expected from this attempt to place education on what was called a natural basis. But Basedow was unaided for the post of director, and the Philanthropin, though protected by the Duke of Dessau, was never numerously attended, and was dissolved in 1793.

¶ *The Epistle of Paul to Philemon*:

New Test. Canon: An epistle of Paul, in conjunction with Timothy (i. 1), to Philemon, whose runaway slave, Onesimus, had come to Rome, and been converted by the Apostle, while the latter was a prisoner (i. 10), and advanced in years (9). Onesimus was most useful to his spiritual father (13), who, however, would not retain him, unless with his master's permission (14). He, therefore, sent him back, carrying the epistle with him, and counselling Philemon to receive him back, not now in a servile capacity, but as a brother beloved (16). Anticipating his speedy release, he also requested Philemon to prepare him a lodging (22). The epistle seems to have been written in A.D. 63 or 64, and to have been sent with the Epistle to the Colossians. Its genuineness is generally admitted.

¶ *The Epistle of Paul the Apostle to the Philippians*:

New Test. Canon: An epistle addressed by St. Paul, in conjunction with Timothy, "to all the saints in Christ Jesus which are at Philippi, with the bishops and deacons." Shortly after Paul had passed for the first time from Asia to Europe, he reached Philippi, then a Roman provincial capital and colony (Acts xv. 12). It lay about nine miles inland. His first convert, Lydia, was from Thyatira, in Asia Minor (Acts xv. 14; cf. Rev. i. 4, 11); his next was a certain dæmned possessed with a spirit of divination (16-18), in connection with whom rioting occurred, followed by Paul's imprisonment, and the conversion of his jailor (19-40). Thus Paul was the founder of the Philippian church. Timothy was subsequently sent into Macedonia, and doubtless to Philippi (xix. 22). Paul himself following (xx. 1-6). (Compare with the facts regarding Timothy, Philippians i. 1, ii. 19-23). The Philippians had offered, than once sent, the apostle pecuniary contributions (iv. 10-18), long being the only church which had done so. Epaphroditus had brought these gifts (i. 25, iv. 18), and afterwards, falling very dangerously sick (ii. 26, 27), Paul had sent him back that the Philippians might be assured of his recovery, apparently requesting him to carry with him the epistle (ii. 28). The apostle when he sent the epistle was a prisoner in Rome (i. 7, 13; iv. 22). He expected release (i. 25; ii. 24), though martyrdom was by no means impossible. He expresses intense affection for the Philippians (i. 8), and thankfulness for their Christian character (i. 4). He counsels them to avoid strife, vainglory, quarrels, controversies (ii. 3, 14), points to the Son of God as the exemplar of humility and self-sacrifice (ii. 5-11), and warns his readers against Judaizing teachers (iii. 2-11), and immoral and self-seeking men (ii. 18, 19). The Christians sending salutations to the church at Philippi were chiefly of Cæsar's household (iv. 22). The genuineness of this epistle is generally admitted, though Bar (1845), and Schwieger (1846), held the contrary view. Its date was probably early in A.D. 63.

1. The term is said by Diogenes Laertius (Proem) to have been suggested by Pythagoras [B.C. 570-504 (?)], who, on being complimented on his wisdom, said that he was not wise but a lover of wisdom, the Deity alone being wise. Philosophy, while earnest in amassing knowledge, aimed chiefly at penetrating to the principles of things. Popularly, it is divided into Natural and Mental Philosophy, the former investigating the physical laws of nature, the latter those regulating the human mind. The term philosophy is now generally restricted to the second of these. Even as thus reduced it has a very wide sphere. Thus, there is a philosophy of history. [HISTORY.] The Hindus have six orthodox schools of philosophy, the Nyaya, the Vaisheshika, the Sankhya, the Yoga, the Purva Mimansa, and the Uttara Mimansa or Vedanta. All the nations of antiquity had a philosophy, that of the Greeks being specially celebrated. The chief schools were: the Pythagorean, commenced about 500 B.C.; the Platonic, B.C. 374; the Peripatetic, B.C. 334; the Sceptic, B.C. 334; the Cynic, 330; the Epicurean, B.C. 306; the Stoic, B.C. 280; the Middle Academy, B.C. 278; the New Academy, B.C. 160; the New Platonists, A.D. 200 (C). Of modern systems the perceptive and sensational philosophy of Locke arose about 1690; the idealistic of Berkeley and Hume, 1710; the common-sense philosophy of Reid, &c., 1750; the transcendental of Kant, &c., 1770; the scientific philosophy of Fichte, 1800; the idealistic philosophy of

Hegel in 1810; the positive philosophy of Comte in 1830; and the evolutionary philosophy of Herbert Spencer in 1852, or more decidedly in 1855. [PESSIMISM.]

"He thought to become happy by *philosophy*, giving his heart, as he tells us, to seek and search out all the things that come to pass under the sun; yet upon trial, he found all this to be vanity and vexation of spirit."—*Sharp's Sermons*, vol. I, ser. 2.

phlorctamic acid, .

Chem.: C₁₂H₁₀N₂O₁₀. Formed by the continued action of strong ammonia on ethyl phlorctic acid. It crystallizes from hot water in slender, shining prisms, dissolves in alcohol and ether, melts at 110, and is coloured blue by ferric chloride. It is a very feeble acid.

phlôr rêl -ic, a. [Eng. *phlorctin*]; *rel* Derived from or containing phlorctin.

phlôrctic acid, s.

Chem.: C₁₂H₁₀O₈. Produced by the action of caustic potash on phlorctin. The potash salt is extracted with alcohol, and, after concentration, the phlorctic acid is precipitated by hydrochloric acid and several times re-crystallized from alcohol. It forms monoclinic prisms, having an astringent taste, melts at 128, dissolves in water and alcohol, and strikes a green colour with ferric chloride. The salts formed by the alkalis and metals are highly crystalline.

Chem.: Compounds formed by the substitution of one atom of an organic radical for one atom of hydrogen in phlorctic acid. Ethylic phlorctate is prepared by heating ethylic iodide with silver phlorctate in a sealed tube to 100. It is colourless, boils above 267, has an irritating taste, and dissolves in alcohol and ether.

phlôr êt in, s. [Etyim not apparent.]

Chem.: C₁₂H₁₄O₈. Prepared by heating a mixture of phlorctin and dilute acid to a temperature of 90°. The phlorctin separates and crystallizes in small white lamina, sparingly soluble in boiling water, but easily in boiling alcohol and acetic acid. It melts at 180, has a saccharine taste, and its alkaline solutions absorb oxygen from the air, forming an orange-coloured substance.

phlôr êt ôl, s. [Eng. *phlorctin*]; suff. -ol.]

Chem.: C₁₂H₁₀O₈. A compound metameric with phenol, and produced by distilling over an open fire a mixture of baric phlorctate and caustic lime. Chem.: C₂₁H₃₀N₂O₁₂. Produced from phlorctin by the combined action of an and ammonia, and purified by precipitation with alcohol acidulated with acetic acid. Chem.: C₂₁H₃₄O₁₀. A substance ready formed in the root-bark of the apple, pear, and other trees, and extracted by weak alcohol. The solution, when decolorized and concentrated, deposits crystals of phlorizin on cooling, in the form of long silky needles, having a bitter taste, and dissolving readily in boiling water and alcohol, but insoluble in ether. By the prolonged action of mineral acids it is converted into phlorctin and glucose. Anhydrous phlorizin melts at 100, and decomposes at 200.

phlôr ô-glû 'cin, s. [Eng. *phlorctin*]; *o* connect., and *glûcin*.]

Chem.: C₁₂H₁₀O₈. Phlorctin. Formed from phlorctin by the action of potash lye. The phlorctate of potash produced is removed by alcohol, and the residue, for neutralizing with sulphuric acid and evaporation, deposits crystals of phlorctin, which may be purified by re-

crystallization. The hydrated crystals belong to the trimetric system, are sweeter than cane sugar, neutral, permanent at common temperatures, and melt at 220°. They dissolve in water, alcohol, and ether, strike a violet-red colour with ferric chloride, and reduce copper salts, like deoxyrose. Phlorctin forms several substitution products, of which trihydro-phlorctin is a type—C₁₂H₁₀O₈.

Chem.: C₁₂H₁₀O₈. A compound obtained by distilling two parts coal-tar creosote with three parts oil of vitriol, and adding peroxide of manganese from time to time. It comes over in yellow drops, which quickly solidify, and it forms, when re-crystallized, fine yellow needles, soluble in alcohol, and slightly soluble in water. It melts at 60, smells like quinine, and, like that body, is turned brown by potash.

1. A character used in phonography; a type or character used for expressing a sound.
2. An instrument for recording and reproducing sounds, invented by Mr. T. A. Edison. It consists of a cylinder of brass, mounted axially upon a steel screw, the pitch of which corresponds with that of a spiral groove on the outside of the cylinder. Attached to the base bound by a movable arm is a mouthpiece with a diaphragm, from the centre of the under surface of which projects a steel point. To use the instrument, the cylinder is wrapped round with tin-foil, and the arm so adjusted that when the axle is revolved, the whole of the groove on the cylinder will pass in succession under the point. On speaking into the mouthpiece, at the same time turning the cylinder, every vibration of the diaphragm causes the point to make a corresponding mark upon the tin-foil. The arm being temporarily turned back, the cylinder can now be set back to its original position, and on turning it with the mouthpiece over the indentations in the type-laden tin-foil, causes the diaphragm to vibrate as before, thus producing the original sounds.

There is a similar bed at the base of the Older White Crag at Sutton. (Lyell.)

phosphate of soda, *s.*

1. *Chem.*: $PO(NaO)_2 \cdot 10H_2O$. Orthophosphate. Common tribasic phosphate. Prepared by treating bone ash with sulphuric acid, and then adding carbonate of soda in slight excess to the acid filtrate. On evaporation the phosphate of soda crystallizes in oblique rhombic prisms, which dissolve in four parts of cold water. It is bitter, purgative, and alkaline to test paper. $NaPO_3$ = metaphosphate of soda. Monobasic phosphate. Formed by the action of heat on acid tribasic phosphate, or microcosmic salt. It is obtained as a transparent, glassy substance, very soluble in water. $Na_2P_2O_7$ = pyrophosphate of soda. Dibasic phosphate. Obtained by strongly heating common phosphate of soda. The residue is dissolved in water and recrystallized. It forms brilliant crystals, which are less soluble than the original phosphate. The meta- and pyrophosphates can be again converted into orthophosphates by fusion with excess of carbonate of soda.

2. *Pharm.*: In large doses it is a saline purgative, in smaller doses a diuretic.

1. The property which many substances and organic beings possess of emitting light under certain conditions.

2. A phosphoric light.

"A large number of substances emit in darkness a phosphorescence." *Watson, Physics, § 625.*

Becquerel traces five causes of phosphorescence: (1) Spontaneous action; (2) Elevation of temperature; (3) Mechanical action, as friction, percussion, or cleavage; (4) Electricity; and (5) Insolation. Examples of No. (1) may be seen among plants in certain fungi; also at times in decaying wood. Among animals, some of Cuvier's sub-kingdom Radiata have the power of emitting light to the dark, especially if they are disturbed,

and the phosphorescence of the sea in tropical, and even at times in temperate climates, is attributed to a small infusorial animalcule, *Noctiluca milhoris* (NOCTILUCA), noted by *Physcia antillarum*, and other *Morida*, *Tinnida*, *Amphibis*, &c. Many small Crustaceans are also luminous. On land, some millipedes, the female glowworm, the fireflies, and (perhaps) some bugs, emit light. In the glowworm the light is from the under-side of the terminal segments of the abdomen. In the case of various Elateride the phosphorescence is from a small, white, oval spot on each side of the thorax. Darwin considers that the phosphorescence of insects has been correctly explained by Mr. Belt to be a signal that they are unpalatable. The well-known phosphorescence of decaying fish is due to the presence of a luminous bacillus. Illustration of No. (2) may be seen in certain diamonds and in fluor spar, which heated to 300-400 become luminous. Illustrations of No. (3) may be observed in phosphorescence when two crystals of quartz are rubbed together, or when a lump of sugar is broken.

2. *Chem.*: Symbol P; at. wt. = 31. A non-metallic pentad element. Found in a state of combination in the unstratified rocks, the soil, the organism of plants, and the bodies of animals. Discovered by Brandt in 1669. It is prepared from powdered calcined bones by treating them with two-thirds of their weight of sulphuric acid diluted with water, evaporating the liquid portion, and, after mixing with charcoal, desiccating by heating in an iron vessel. The dry mass is then introduced into a stone retort, heated, and the phosphorus evolved collected under water. It resembles imperfectly bleached wax, is soft and flexible at common temperatures; sp. gr. 1.77; vapour density, 4.35; melts at 42.2°, and boils at 287°. On cooling, it sometimes forms dodecahedral crystals. It is insoluble in water, and is kept in that liquid, but dissolves in native naphtha and bisulphide of carbon; is very inflammable, and sometimes takes fire from the heat of the hand. A remarkable modification exists under the name of amorphous phosphorus, prepared by exposing common phosphorus to 250° for fifty hours. It is a reddish-brown infusible substance, insoluble in bisulphide of carbon; sp. gr. 2.089 to 2.106. It is not luminous in the dark, and can be reconverted into ordinary phosphorus when heated to 260°. Used on a very large scale in the preparation of safety matches. [BIOLOGIA-PHOSPHORUS.]

phosphorus poisoning, s. *Chem.*: Phosphorus, especially when finely divided, is highly poisonous. Fatal effects are sometimes produced by very small doses, the use of .11 grain having ended fatally. Some hours often elapse before the worst symptoms appear, consisting generally of a burning pain, vomiting, and, after two or three days, jaundice, and large effusion of blood. It is not very amenable to antidotes unless they are applied at an early stage, but an emetic should at once be administered, in the form of 10 grains sulphate of zinc or 30 grains of powdered ipecacuanha, or, if these are not at hand, some mustard in hot water. One dram of French oil of turpentine should then be given floating on water, and repeated in half-dram doses every half-hour for some time.

[Pref. phōt, and Eng. collotype.] A process of printing from the surface of a film of gelatine, based upon the fact that gelatine, exposed to light, in the presence of an alkaline bichromate, loses its power of absorbing water. A piece of plate-glass is coated thickly with a solution of gelatine and potassium bichromate, dried in the dark, and exposed to light under a reversed positive. It is then turned over and exposed, through the glass, to diffused light for a short time to diminish the swelling caused by the subsequent wetting. After well washing to remove the superfluous bichromate, it is rolled with greasy ink, which only adheres perfectly to the parts which have not absorbed water, and to the others in proportion to their dryness. The subsequent manipulations are as in lithography.

phō tō ē lēc trō tŷc, s. [Pref. phōt, and Eng. electrotype (q.v.).] A block made mainly with the aid of photography and of the electrotyping process, and which can be printed with type like a woodcut. A photographic negative of the subject required is printed on a film of gelatine which has been treated with bichromate of potash, to render it sensitive to the action of light. Those parts on which the light has not acted are soluble in water, and are washed away, leaving the printed parts that are insoluble in relief. From this relief a mould in wax is taken, and an electrotype made in the usual way. Unless special means are taken to translate the half-tones of the photograph into line or stipple, this process is only available for reproducing drawings, &c., in black and white.

phō tō cŷn grav īng, s. [Pref. phōt, and Eng. engraving (q.v.).]

A term applied to processes for producing printing blocks or plates by photography. The most commonly employed process is to coat a metal plate with a thin film of asphaltum, and expose it to light under a reversed positive. The picture is next developed by dissolving away the parts of the asphaltum not acted upon by the light, and the plate is subsequently etched in the usual way. This process is sometimes called Photo-aquatint. The second method is more elaborate. A film of bichromatized gelatine, on a sheet of glass or a copper plate, is exposed under a photographic negative, and the unprinted portions which are soluble in water washed away, leaving the printed parts in relief. The plate with the relief is next coated with a film of

silver by electro-deposition, and placed in an ordinary electro-typing bath, in which it is allowed to remain until a shell of copper from one-sixteenth to one-eighth of an inch thick (according to size of plate) is formed. This, after the rough excesses have been removed by filing, becomes the printing plate. It can be worked upon by an engraver, if necessary, to remove photographic defects, and is printed at a copper-plate press. When a relief block is required, a reversed negative is used to print from, and the etching is carried to a much greater extent. For half-tone blocks a glass screen engraved with very fine lines is placed between the subject and the camera, and the photograph produced is broken up by the screen into lines and dots. The plate is then etched, leaving the lines and dots in relief for printing.

phô tôg-râ phỹ, s. [Pref. *phô tô*, and Gr. γραφειν (*graphēin*) = to write; Fr. *photographique*.]

The art of producing pictures by the action of certain sensitive substances, under the influence of light. It may be said to have sprung from the discovery, some three hundred years ago, that the luna cornua of the alchemists—i.e., fused silver chloride—would darken on exposure to light. Nothing more was known until in 1777 Scheele, the Swedish chemist, noticed that the power which produced this darkening resided chiefly in the violet end of the solar spectrum. In 1802 Thomas Wedgwood published his method of taking profiles, upon paper or white leather treated with nitrate of silver, and exposed to the light of the sun under the object to be represented. For many years no method was known of fixing the picture, i.e., of dissolving away the unaltered sensitive salt; but the difficulty was eventually overcome by Sir John Herschel, when he suggested the use of hyposulphite (thiosulphate) of soda, a salt now used for the same purpose in hundreds of tons. M. Niepce was the first worker with bitumen of Judaea, which loses its solubility in certain media when exposed to the light, and his method has since been unanimously developed as the basis of photoetching, and many other processes. The year 1839 was one of paramount importance in the history of photography, for then Henry Fox Talbot published his calotype process, in which paper, having on its surface chloride of silver, was exposed in a camera obscura (q.v.), and the image developed by a solution of gallic acid. The discovery of this kind of development, which marks an epoch in the history of photography, is due to the Rev. J. B. Reade. The pictures so produced were negatives (q.v.), and from them positives were obtained by exposing to light, under them, another sensitive sheet. The substitution, in the next year, of silver iodide for chloride, greatly improved the process, which was now thoroughly workable, and by its means many beautiful results have been obtained. In the same year, Mungo Ponton observed the sensitiveness to light of paper containing bichromate of potash. This phenomenon, the true nature of which was explained by Becquerel in 1840, has given birth to the carbon process, the Woodburytype (q.v.), and many others. The world-famous Daguerreotype process was also published in 1839, a film of silver iodide on a plate of silvered copper, being the sensitive material, the pictures on which were developed by the vapour of mercury. This process is still used for making photographs from which accurate measurements are to be taken. In 1850 the art of photography was greatly advanced by the introduction of Mr. Scott Archer's process, in which the sensitive iodide and bromide of silver are held in a film of collodion, on glass, the image being developed with pyrogallie acid, or a ferrous salt. The next great step forward was the adoption of alkaline development for dry plates. The collodion process (q.v.) still holds its own for many purposes, and was universally employed until a few years ago, when it was once more completely revolutionised by the introduction of gelatine, which may be spread either upon glass or paper, as a medium for holding the sensitive salts. The sensitiveness of these gelatine plates is so great that photo-

graphs of express trains in motion, leaping horses, and birds on the wing are of every day occurrence. The application of photography to astronomy has been attended, of late years, with truly remarkable results, for we have now pictures of every object in the heavens, from the nebula in Orion to the spots upon the face of the sun himself. Photographs in colour, upon silver chloride, have been exhibited. phô-tô gra-vũre, s. [Fr.] A term applied to methods of producing, by photography, plates for printing in a copper-plate press. The processes are kept secret; but, in one of them, the translation of photographic half-tones into the corresponding grain required for printing, is said to be effected by the aid of a substance which crystallizes when exposed to light, the size of the crystals depending upon the amount of light they receive. Such a substance, exposed under a negative, will give a surface, the grain of which will exactly correspond with the lights and shades of the picture, and from which an electrotype can be made for printing purposes.

[Pref. *phô tô*, and Eng. *lithographic* (q.v.).] A mode of producing by lithographic means designs upon stones, from which impressions may be obtained in the ordinary lithographic press. A sheet of suitable paper is coated with gelatine containing bichromate of potash, and exposed under a negative. The surface is then inked with lithographic transfer ink. The paper is next floated, face upwards, in hot water, until the unaltered gelatine swells; then the superfluous ink and soluble gelatine are removed by gentle sponging with hot water. The resultant image is transferred to stone and printed by lithography (q.v.). There are other methods in some the stone itself is coated with sensitive gelatine; or an exposed sheet of potash may be damaged and transferred to the stone at once. The gum not rendered insoluble by the action of light adheres to the stone. The ink subsequently applied only adheres where there is no gum. Proofs are taken by lithography.

It depends upon the fact that the resistance offered by the metal selenium to the passage of a current of electricity varies in proportion to the intensity of the light which may be falling upon it. A parallel beam of powerful light is reflected from a silvered diaphragm, and received in a paraboloidal mirror in the focus of which is a selenium "cell," connected with a battery and Bell telephone. Any sounds which cause the diaphragm to vibrate produce a corresponding variation in the reflected light, which in its turn alters the resistance of the selenium cell to the current from the battery, and so reproduces in the telephone the original sounds. The instrument, which is due to Prof. Graham Bell and Sumner-Tainter, is only workable over short distances.

The model stands, in a studio of special construction, in the centre of a circle of twenty-four cameras, all of which he is photographed at the same moment. The twenty-four negatives are then projected in succession upon a screen by means of an optical hubbin, and the artist goes over the outline of each with the tracer of a pantograph, a cutting tool acting upon a lump of modelling clay, mounted upon a turntable, being substituted for the usual pencil. After each photograph is gone over, the clay is turned through fifty degrees, and when a complete revolution has been effected, it is removed and finished by hand.

Science: The theory or doctrine which teaches that a relation exists between the several faculties of the human mind and particular portions of the brain, the latter being the organs through which the former act. That the brain, taken as a whole, is the part of the human body through which the mind operates, had been from ancient times the general belief; but the localization of the several faculties was first attempted by Dr. Franz Joseph Gall, who was born at Tiefenbrunn in Styria, March 9, 1757; first promulgated his views in a course of lectures in his house at Vienna in 1796; gained, in 1804, a valuable assistant in Dr. Spurzheim; journeyed with him in 1807 to Paris, where a commission appointed by the Institute reported very unfavorably of his system; and died Aug. 22, 1828. When Spurzheim visited Edinburgh, he met Mr. George Combe who adopted his views, and in 1819 published *Essays on Phrenology*, ultimately developed into his *System of Phrenology* which became very popular. Gall enumerated nearly thirty, Spurzheim thirty-two, mental faculties which he considered as primitive. These Spurzheim divides into moral, or affective, and intellectual. The affective faculties are subdivided into propensities producing desires or inclination, and sentiments, which along with this excite some higher emotion. The intellectual faculties are similarly divided into perceptive and reflective. They were then localized on the brain, or rather on the skull, for phrenology during life can observe only the skull of an individual, and even that with flesh, skin, and hair intervening; and there is not always a correspondence between the form of the skull and that of the brain. The phrenological charts will show the localities of the various organs.

I. Affective propensities—

- 1. Amativeness; 2. Philoprogenitiveness; 3. Inhabitiveness; 4. Adhesiveness; 5. Combattiveness; 6. Destructiveness; 7. Self-defence; 8. Veneration; 9. Constructiveness; 10. Subtlety.

II. Sentiments—

- 1. Self-esteem; 11. Love of approbation; 12. Cautionness; 13. Benevolence; 14. Veneration (situated on the crown, between 13 and 15); 15. Firmness; 16. Conscientiousness; 17. Hope; 18. Marvellousness; 19. Ideality; 20. Mirthfulness; 21. Imitation; 22. Individuality; 23. Configuration; 24. Size; 25. Weight and Extensiveness; 26. Colour; 27. Locality; 28. Calculation; 29. Order; 30. Eventuality; 31. Time; 32. Melody; 33. Language; 34. Comparison; 35. Causality.

PHRENOLOGICAL CHARTS.

In constructing these terms Spurzheim says: "I have employed the term *-ise* as indicating the quality of producing, and *-ness* as indicating the abstract state; I have therefore joined *-ness* to different roots or fundamental words."—*Phrenological System* (1815), p. ix.

Spurzheim seems to have considered the most unassailable point in phrenology to be the connection between amativeness and the cerebellum. He says:

"Indeed, it is impossible to unite a greater number of proofs to demonstrate any natural truth, than may be presented to determine the function of this organ."—*Ibid.*, pp. 27, 28.

Dr. Wm. Carpenter brings many facts from comparative anatomy to show that this cannot be the exclusive use of the cerebellum, though he does not commit himself to the view that it is not the function of the central lobe, the two others being connected with the locomotive function. Since that time (1823) Phrenology has been losing ground, and its place is now taken by the local-

ization of brain functions based on investigation.

falline body produced by the action of ammonia on phthalic anhydride. It forms a mass of silky flexible needles soluble in water, melts at 130°, and sublimes at a higher temperature.

phthāl-a-mine, s. [Eng. *phthal(ic)* and *amine*.]

Chem. : $C_8H_9NO_2$. An oily body heavier than water, produced by the action of ferrous acetate on nitronaphthalene, treating the crude product with sulphuric acid, and precipitating by ammonia.

phthāl-dē-hyde, s. [Eng. *phthal(ic)* and *aldehyde*.]

Chem. : $C_8H_6O_2 = C_6H_4 \begin{matrix} (CH_2) \\ | \\ CO \end{matrix} O$. Obtained by digesting an ethereal solution of phthalic chloride with zinc and dilute hydrochloric acid. It crystallizes in small rhombic plates which melt at 65°, is slightly soluble in cold, more so in hot water, and is readily oxidized to phthalic acid, by an alkaline solution of potassium permanganate.

phthāl-ic, a. [Eng. (*no*)*phthal(ene)*; -ic.] Derived from or contained in naphthalene.

phthalic acid, s.

Chem. : $C_8H_6O_4 = C_6H_4(COOH)_2$. Alizaric acid. A dibasic acid produced by the action of nitric acid on naphthalene, alizarin, purpurin, &c., crystallizing in shining, colourless tables or prisms, slightly soluble in water, very soluble in alcohol and ether; it melts at 182°, and at higher temperature decomposes into water and phthalic anhydride. The phthalates are all crystalline, and, with the exception of the alkali salts, difficultly soluble in water. The baric salt, $C_8H_4(COO)_2Ba_2$, crystallizes in plates. Dimethyl and diethyl phthalates, both colourless oily liquids, are obtained by the saturation of solutions of the acid in the respective alcohols.

Obtained by distilling phthalic acid, or by treating phthalic acid, with one molecule of phosphoric chloride. It crystallizes in fine shining needles, melts at 120°, boils at 277°, and dissolves in alcohol and ether. With boiling water it is slowly resolved into phthalic acid.

phthalic ethers, s. *pl*.

Chem. : The ethyl-, amyl-, and phenyl-ethers, $C_8H_4(C_2H_5)_2O_2$, &c., are heavy oily liquids produced by the action of the corresponding alcohols on phthalyl-chloride. (*H. Muller*.)

It forms beautiful needles of the colour of realgar, melts at 22°, boils at 260°, is slightly soluble in water, but very soluble in warm alcohol and ether. Its salts are mostly soluble in water and in alcohol.

phthāl-ī mide, s. [Eng. *phthal(amic)* and *imide*.]

A colourless, inodorous, and tasteless body, obtained by heating phthalate or phthalamate of ammonia. It crystallizes in six-sided prisms, insoluble in cold water, slightly soluble in hot water, easily soluble in boiling alcohol and ether. It is not attacked by chlorine or by weak acids, but on boiling with an alcoholic solution of potash it evolves ammonia and forms potassium phthalate.

Music : A musical instrument, the sounds of which are produced by blows from hammers, acted upon by levers called keys. This is probably the most widely-known and generally-used musical instrument in the world. Although slight improvements are from time to time made in its mechanism, it may be described as the perfected form of all the ancient instruments which consisted of strings struck by hammers. Originally the strings were placed in a small and portable box, and struck by hammers held in the hands. In this early shape, known as the "Dulcimer," the instrument can be traced in nearly every part of the globe, and it now survives, almost in its original form, both in Europe and Asia. The dulcimer was also called psaltery, santur, or sawry. The name given to the first instrument with keys acting on hammers was clavichorium, or keyed-cithara, which was introduced in the fifteenth, or early in the sixteenth, century; next came the clavichord, or clarrichord, sometimes called monochord, in which quills plucked the strings; the

angular soon followed, which was an oblong instrument with an improved form of jack containing the quill; this was soon followed by the spinet, of similar construction but generally triangular in shape; then came the harpsichord, a vast improvement on its predecessors, having a more extended compass and often two manuals. The earliest form of pianoforte, early in the eighteenth century, was, perhaps, in some respects, inferior to a fine harpsichord, but it possessed the elements of expansion, as now exhibited in a modern grand in-hood pianoforte of seven octaves compass, with every gradation of sound, from pianissimo to a splendid fortissimo, and the most sensitive and delicate mechanism between the finger and the hammer.

After Spener's death the Executive interfered, and proscribed the open profession of Pietism, so that its professors had no opportunity of forming a new sect.

"The principal reforms demanded by the *Pietists* to be gathered from the writings of their leaders, were these: First, that the theological schools should be reformed by the abolition of all systematic theology, philosophy, and metaphysics; and that morals, not doctrine, should form the staple of all preaching. Secondly, that only those persons should be admitted into the Lutheran ministry whose lives were samples of living piety." *Grant. Dict. Sects.*, p. 430.

It is one of the largest British freshwater fishes, sometimes attaining a length of five or six feet, and was formerly much esteemed for food. Pikes are extremely voracious, and, though small fish and frogs form their staple food, the remains of ducks and geese have been found in their stomachs. They are very long-lived; and on the evidence of rings, which in the middle ages were sometimes put in their gill-covers, it has been maintained that some individuals have been captured at the mature age of 250 years. They commence to spawn at three years old; the ova are deposited in March, and the spawning season lasts about three months. The Pikes are migrants, and have been known to travel overland. They are common in shoals to the Isle of Ely, whence they come in shoals to the river Cam; and their bones are often found in the peat of the fens, whence it has been concluded that they are natives, and not artificially introduced. The head and back are olive-brown, sides paler, belly silvery white; body mottled with roundish spots, which sometimes form cross-bars on tail. The English name has reference to the elongated form of the fish, or the shape of its snout.

Ichthy. : *Naucratés ductor*, a small pelagic fish, about a foot long, of bluish colour, marked with from five to seven broad dark vertical bars. It is the *pompilus* of the ancients; and Ovid (*Ial.* 161) calls it *comus ratiunum*. The connection between this fish and the shark has been accounted for in various ways; but it is probably a purely selfish one on the part of the pilot-fish, which obtains a great part of its food from the parasitic crustaceans with which sharks and other large fish are infested, and from the small pieces of flesh left unnoticed when the shark tears its prey. The pilot-fish is never, so far as is known, attacked by the shark; but that is probably because the smaller fish is too nimble for the larger one. "The art of pisciculture is of great antiquity, and is alluded to in Isa. xiv. 10. Shaw, of Dundee, revived the art in Britain in 1833, as Reuvy, a fisherman of Vosges, did in France in 1842. He and another fisherman, Gehin, in 1849, received medals for their services from the French government, which soon afterwards set up an establishment of its own at Huningue. In 1857, Mr. Bust successfully reared salmon from ova in ponds at Storm-on-field, near Seone, in Perthshire. In April, 1863, Mr. Ponders set free in the Thames 76,000 young salmon, trout, char, and grayling, and on many occasions since then young fish have been liberated in the upper reaches of the river. The late Frank Buckland, Inspector of Fisheries, did much to advance pisciculture. In addition to the direct attempt to rear fish, efforts are made to remove the obstacles which impede their multiplication. Biological stations have been established at Plymouth, St. Andrews, Millport, Port Erin, &c., and in many places on the Continent, where experiments are carried on as to the breeding and rearing of marine food-fishes.

Maoh.: A device so fitted as to occupy the sectional area of a tube and be capable of reciprocation by pressure on either of its sides. It may be of any shape corresponding accurately to the bore of the tube; but the cylindrical form is almost exclusively employed for both, as in the common pump and the steam-engine. One of its sides is fitted to a rod, to which it either imparts reciprocatory motion, as in the steam-engine, or by which it is itself reciprocated, as in the pump. In the former case, it has no opening leading from one side to the other, and is termed solid, though generally not really so; but in the latter, an aperture controlled by a valve permits the passage of the fluid from one side to the other during its downward movement. A distinction is, however, made in pumps; the solid piston being known as a plunger, the hollow piston as a bucket. The piston usually requires packing to cause it to fit closely within its cylinder, and at the same time allow it its free backward and forward movement.

II. Pathol.: A peculiarly malignant fever of the continued and contagious type, now believed to be almost identical with the worst kinds of typhus fever. It is produced by the absorption of a poison generated by decaying animal matter combined with heat, moisture, and bad ventilation. The fumes produced by the ravages of locusts, and the subsequent decay of their bodies, often generate it. The period of incubation varies from a few hours to three weeks. It chiefly attacks the cervical, axillary, inguinal, and mesenteric glands, producing buboes, carbuncles, &c. The "bail" from which Hezekiah suffered seems to have been the carbuncle of 2 Kings xx. 7. (Isaiah xxxviii, 21.) At first there is great restlessness, followed ultimately by corresponding exhaustion, and death supervenes in two or three days. Grand Cairo is the chief known focus of the plague, the spread of which, in different directions, is at least attempted to be checked by quarantine. The plague seems to have been the Black Death of the fourteenth century. It was known by the name of plague when, in 1665, it slew in London 68,596 people, about one third of the population. The great fire of London (1666) obtains the credit of having banished the plague from the metropolis by destroying the fever-nests which it had infested.

It is a native of Western Asia and Cashmere, and has been introduced into British parks and plantations. Its smooth-grained wood is used in the East for cabinet-making. Mr. Homburger says that in India its bruised leaves are applied to the eyes in ophthalmia, and its bark, boiled in vinegar, given in diarrhœa. The Occidental or American Plane-tree, *Platanus occidentalis*, has less deeply divided and incised leaves, and membranous lacinæ along the leaf-edges. world observers, seemed to wander about aimlessly in the sky, thus markedly contrasting with the orderly movements of the fixed stars. Subsequently it was discovered that the seemingly erratic bodies were as regular in their movements as the others, revolving, like the earth, around the sun, the aberrations arising from the fact that both the planets and the observers were in motion. When they are comparatively near the earth and move thence to go round the sun, they seem to go in one direction; when they return on the other side of their orbit, they appear to retrograde in the sky, shining only with reflected light, they shine with a steady radiance in place of twinkling like the fixed stars. Planets are primary or secondary, the former revolving around the sun, the latter around the primaries. The primary planets known to the ancients were five, Mercury, Venus, Mars, Jupiter, and Saturn, emitting asteroids, comets, and meteoric rings, eight are now known, Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Twenty secondary planets are known, the Moon, two satellites of Mars, four of Jupiter, eight of Saturn, four of Uranus, and one of Neptune. The existence of an intermercurial primary planet has been suspected but not proved. The planets Mercury and Venus, being nearer than the Earth to the Sun, are called inferior planets; the others, being more distant, are termed superior. Another classification is sometimes adopted, that into intra- and extra-asteroidal planets, that is, those nearer and those more remote from the sun than the asteroids. Under the first are included, Mercury, Venus, the Earth, and Mars, all of which are comparatively small, while the others, Jupiter, Saturn, Uranus, and Neptune are the giants of the system. For instance, the Earth is 7,918 miles in diameter, and Mars 4,200, but Jupiter is 85,000. The intra-asteroidal planets complete the annual revolution in short periods, the Earth, for example, in 365.256 days, while Neptune takes to do so 60,127 days, or about 165 years. The minor planets, planetoids, or Asteroids are between Mars and Jupiter. A list of those named up to the end of 1881 was given under Asteroid (q.v.).

planet struck, **planet stricken**, **planet strook**, *n.* Affected by the influence of a planet; blasted.

"Planets, *planet struck*, real eclipse. Then suffer." *Milton; P. L.*, x. 441.

planet wheel, *s.*

Engineering: The exterior revolving wheel of the "sun and planet" motion, invented by James Watt. So called from its rotation around another gear-wheel, which is termed the sun-gear. The axis of the planet-gear is preserved concentric with the axis of the central or sun-wheel by means of an arm. The planet-wheel sometimes gears with an internally cogged wheel, and may be driven by the latter, rolling around inside the larger gear-wheel instead of outside. [SUN-AND-PLANET-WHEELS.]

II. *Technically*:

1. *Nat. Science*: Linnæus defined a plant as an organised body (being) possessed of life, but not of feeling. In his contrasted definition of an animal, he assigned the latter life, feeling, and voluntary motion, implying that if a plant moved it did not do so voluntarily. His definition is essentially accurate. With regard to all the higher members of the Vegetable and Animal Kingdoms, there is no difficulty in saying which is a plant and which is an animal. Some Monists, &c., have a certain sensitiveness when touched, but notwithstanding this they are clearly plants. But "Natura non facit saltus" (Nature does not make leaps, that is, abrupt transitions); and the humbler members of the two kingdoms are so closely akin, that whether sponges were animal or vegetable was once a debatable question, though now they are considered compound animals, while again many of Ehrenberg's Infusoria, once ranked as animals, now figure as humble Algae. Plants derive their nourishment directly from the mineral kingdom, animals do so only through the intervention of plants. The latter are, as a rule, composed chiefly of carbon, hydrogen, and oxygen; animals have nitrogen as well. Plants generally absorb carbon dioxide, and give

both oxygen; animals reverse the process. With slight exceptions cellulose and chlorophyll are distinctly vegetable productions. A plant consists of a root, of organs of vegetation, and organs of reproduction. It may be annual, biennial, or perennial (q.v.). It may be a herb, an under-shrub, a shrub, or a tree. It may be evergreen, or have deciduous leaves. In winter there is a suspension of assimilative power and growth, like the hibernation of animals. The close of petals and the folding of leaves at night in some plants suggest their sleep. Like animals sooner or later they die. De Candoille conjectured that the known plants were from 110,000 to 120,000.

Much uncertainty exists as to the place in the system of many species of fossil plants, and scientific names frequently indicate that doubt. Though there is much doubt as to fruit, there is more as to leaves, for they often have the same form and venation in orders remotely apart from each other. Hence at present the vegetable unit is much less valuable than the animal in investigating fossils. The first appearance of plants seems to have been in the Silurian rocks; they were probably Algae. In the Upper Silurian Aetogenous and Confertis first appear. The Aetogenous greatly pre-dominates during the Carboniferous period; the Cycads attained their maximum during the Jurassic and Lower Cretaceous. Theorycladons began apparently before the close of the Cretaceous, and became dominant in the Tertiary.

When exposed to light under the negative, the ferric oxalate becomes converted into ferrous oxalate in exact proportion to the amount of light it has received. The picture is developed by floating the exposed paper upon a solution of potassium oxalate, 150 grains to the ounce, at a temperature of from 170-180°. The ferrous salt formed by the action of the light reduces the platinum to a metallic state in the presence of the potassium oxalate solution, thus forming the image. A wash in dilute hydrochloric acid, 1 in 80, completes the process.

plât-in-ûm, *s.* [LATINA.]

Chem.: Symbol, Pt. Atomic weight, 197.4; sp. gr. = 21.6. A tetrad metallic element discovered first in America, and still largely obtained from that country; also found in the Ural chain, and in copper ore from the Alps. [PLATINUM-ORE.] The ore is treated with nitromuriatic acid, which dissolves platinum and palladium, the solution is then treated with potassic chloride, yielding the double salt of platinum and potassium—the palladium being left in solution. By igniting with carbonate of potash, the platinum is reduced to the metallic state. It still contains traces of iridium, which gives it greater hardness and tenacity. Pure-forged platinum takes a high lustre, is nearly as white as silver, and very ductile and malleable. It resists the strongest heat of the forge-fire, but can be used by the electric current; is the heaviest known substance excepting osmium and iridium, is unalterable in the air, dissolves slowly in nitromuriatic acid, but is not attacked by any single acid. Its properties render it extremely useful to the chemist for the construction of crucibles, evaporating dishes, and stills used in the concentration of oil of vitriol.

platinum are capable of taking up ammonia and forming amines, e.g., diamminoplatinous chloride = $(\text{H}_3\text{N})_2\text{PtCl}_4$ is obtained by neutralising a solution of platinum chloride in hydrochloric acid with carbonate of ammonia, heating to the boiling point, adding to it ammonia, and allowing to cool. It is a greenish-brown solid body, soluble in hydrochloric acid as dichloride, if protected from the air. It dissolves in caustic potash, and all the platinum is thrown down as platinum-black on the addition of alcohol. With metallic chlorides it forms double salts, most of which are highly crystalline. (2) Platonic chloride, PtCl_4 . Obtained by dissolving platinum in nitromuriatic acid and evaporating over the water-bath. It forms a brown-red mass, easily soluble in water, and combines with potassium chloride to form one of the most important double salts of platinum, K_2PtCl_6 , insoluble in alcohol.

Chem.: Platinum forms two oxides. (1) Platinum oxide, PtO , obtained as a hydrate, $\text{Pt}(\text{OH})_2\text{O}$, by digesting platinumous chloride in warm potash. At a gentle heat it becomes anhydrous, and dissolves slowly in acids, forming unstable salts. (2) Platonic oxide, Pt_2O_3 , obtained with difficulty by decomposing a solution of platonic sulphate with carbonate of calcium, and dissolving out the calcium sulphate and carbonate with weak acetic acid. It is a black powder, which dissolves in acids, forming uncrystallizable salts.

(*Hist. of Philos.*, ed. 1880, i. 229) says: "I come to the conclusion that he never systematically laid his thoughts, but allowed free play to scepticism, taking opposite sides in every debate, because he had no steady conviction to guide him; unsaying to-day what he had said yesterday, satisfied to show the weakness of an opponent." Geol.: The epithet applied by Sir Charles Lyell to the most modern of the three periods into which he divided the Tertiary. Its distinguishing character is that the larger part of the fossil shells are of recent species. Lyell divides it into the Older and the Newer Plocene. In the Older, the extinct species of shells form a large minority of the whole; in the Newer, the shells are almost all of living species. De Sleyes and Lyell considered that the Older Plocene had 25 per cent. and the Newer 90 to 95 per cent. of the shells of recent species. Etheridge makes the number 40 to 60 per cent. for the Older and 80 for the Newer Plocene. Lyell's divisions (in reverse order) of the Plocene are these:

OLDER PLOCENE.—*British*: Red Cray of Suffolk, White or Coralline Cray of Suffolk, *Engrain*, *De la Pen*, and *Antwerp* Cray, *Sable*, *Apron*, *Marls*, and *Sand*, and Plocene of North America. (Deposit of Fikens, near Athens, strata of the Soudak Hills.)

NEWER PLOCENE.—*British*: Forest bed of Norfolk, *Cliff*, *Norman* rag, *Flint*, *Eastern* base of Mt. Etna, *Swedish* strata, *Lower* strata of Upper Eocene, *Almo*, *German* and French Plocene.

Etheridge places also under the Older Plocene the *Arabo-Asiatic* large fresh-water formation, and under the Newer the *Chalcedon* and *Burington* beds. There is a rich Plocene flora in Italy. Mr. Gardin and the Marquis Strozzi cultivate pine, oak, evergreen oak, pear,

plane, elder, fig, laurel, maple, walnut, birch, locust, etc. In the British Phloeine of Craig, Etheridge enumerates 28 genera, and 140 species of animals; thirty genera, and fifty-seven species are mammalia. Both Vesuvius and Etna were in operation. In Mull there are phloeine rocks (granites and syenites) of this comparatively recent age. The climate, at first temperate, was becoming severe, and the Newer Phloeine was contemporaneous with part of the Glacial Period (q.v.).

Church Hist. (PL.): A body which arose almost simultaneously in various places about 1830, and, as they called themselves "The Brethren," outsiders came to know them as "Plymouth Brethren" from the town where they were at first most numerous. Their chief founder was a barrister, named Darby, who had taken orders. Their communities are of what is known as the Evangelical Calvinistic type, and many of them maintain that only among themselves is true organized Christianity to be found. They have no salaried ministry, every brother being at liberty to prophesy or preach whenever moved to do so, as among the Society of Friends. The majority are Baptists, though not all; and they observe the Sacrament of the Lord's Supper weekly. Most of them are also rigid Predestinarians and expect the Millennium. They are a growing sect, but are broken up into sections owing to disputes, arising chiefly from questions concerning the nature of Christ, accentuated by a personal dogmatism, which appears to be developed by their distinctive methods.

II. *Technically*:

1. *Pharmac.*: Professor Christison divides poisons into three great classes: irritants, narcotics, and narcotico-acrids or narcotico-irritants. A fourth class is sometimes added, scyphes, consisting of animal poisons, such as the fangs of rabid animals and venomous snakes, the stings of insects, and the poison generated by postidental carabidae, &c. An irritant poison produces violent pain and cramp in the stomach, nausea, vomiting, convulsions, &c. A narcotic poison produces stupor, numbness, drowsiness, coldness, and stiffness of the extremities, cold fetid greasy perspiration, vertigo, weakened eyesight, delirium, paralysis of the lower extremities, &c. A narcotico-acrid poison produces a certain combination of the symptoms attendant on both the former classes. The chief irritants are the acids and their bases, some alkalis and their salts, the metallic compounds, as arsenic, mercury, the vegetable acids or irritants, as some Cucurbitaceae, Euphorbiaceae, Ranunculaceae, &c.; animal irritants, as emulsaries; mechanical irritants, as glass, &c.; irritant gases, as chlorine, the vapour of nitrous acid, &c.; narcotico poisons, as opium, nightshade, prussic acid, &c.; narcotico-acrids, such as strychnine, *Cocculus indicus*, and poisonous mushrooms. Savages poison their arrows by the milky juice of various Euphorbias or by the unchained, or by the juice of two species of *Strychnos*. Both in man and in the inferior animals there is often a curious correlation between the colour of the skin and hair and immunity from the action of certain vegetable poisons. Metallic poisons act upon vegetables nearly as they do upon animals, that is, they are absorbed into the different parts of a plant, destroying the structure. Vegetable poisons, especially those which destroy animals by action upon their nervous system, also cause the death of plants.

2. *Law*: By the Pharmacy Act, 31 & 32 Vict., c. 121, only qualified persons are allowed to sell poisons. In all cases the word "poison" and the name and address of the vendor must be upon the label. No poisoned seed, grains, or fish must be exposed on land.

The Polar Bear is from seven to eight feet long, with a narrow head, and the forehead in a line with the elongated muzzle, short ears, and long neck. It is quite white when young, changing to a creamy tint in maturity. Unlike most of its congeners, it is carnivorous, attacks by biting, not by lunging, and only the pregnant females hibernate. Many tales are told of its ferocity, which appear to have been exaggerated by early travellers, and the probability is that, unless interfered with or pressed by hunger, it rarely attacks man.

* (1) *Polarization of light*:

Optics: A state into which the colored undulations which cause the sensation of light are brought under certain conditions. These undulations are perpendicular to the line of transmission of the wave, as in a stretched

cord, but, in a ray of common light, appear to take place successively in all directions in the manner shown in the diagram A (but with the transitions far more gradual), the vibrations successively passing through rectilinear, elliptical, and circular phases with incommensurable rapidity. If, now, the vibrations become,

or are rendered, stable in any one form of orbit, the light is in the condition known as polarized, and the state is one of plane, elliptical, or circular polarization, according as the orbit resembles b, c, or d. The most familiar and simple form is that of plane polarization. This may be produced in various ways, the piece of apparatus producing such modifications being called a Polarizer. When produced, however, the effects can only be perceived by examining them through another piece of apparatus which, used alone, would polarize the light, but when used to examine light already polarized, is called the Analyzer. The two in combination, with the necessary adjustments, form a Polaroscope, of which there are many forms.

(a) *Plane polarization*: When a ray of common light passes through a crystal (not of the cubic system), the atoms being so arranged that the elasticity (or elastic) properties affecting motions of the ether within the crystal are different in different directions, the ether motions are at once resolved into that of the greatest and the least elasticity at right angles to the path of the ray, so dividing the ray of common light into two "plane polarized" rays, polarized in planes at right angles to each other. One of these rays being easily eliminated by total reflection in the Nicol prism (q.v.), two such prisms form a convenient polariscope. The ray, after passing through the first prism, appears just like common light, only of half the original brilliancy; but on looking at it through the second Nicol, on turning the latter round, we find two positions in which the light from the first Nicol gets through the second unaltered; and two positions at right angles to the former in which it is absolutely stopped, and the second prism, though clear as glass, is absolutely opaque to it. The beam of light appears thus to have acquired sides, and to behave differently according to the relation these sides bear to the position of the prism. Such is the fundamental nature and phenomenon of Polarized Light. Light is also polarized by reflection from polished transparent surfaces, when incident at such an angle that the reflected and refracted rays make a right angle. In glass, this angle is about 56°. An exactly equal quantity of the incident light which is transmitted through the glass, is polarized in a plane at right angles to the former. At other angles the effect is partial. The scattered light of the sky is always more or less polarized, as is all light reflected from small particles in air or water, if the particles are small enough; the polarizing angle for such particles is, as might be expected, 90°.

(b) *Chromatic polarization*: Let the perpendicular vibrations from a Nicol prism encounter in their path a crystalline film of selenite or mica, whose planes of greatest and least elasticity are arranged diagonally. The perpendicular vibrations are again "resolved" into two sets, one of which is retarded behind the other owing to the difference in the two elasticities. The analyzer "resolves" each of these again, bringing half of each set back into one plane. The two sets of waves are then in a position to exercise interference, and the consequence is that, if the plate or film is of suitable thickness, the most gorgeous colours are presented. It is the same with every substance having different elasticities in different directions, and as all "structure" presents such differences, polarized light becomes the most powerful weapon of the biologist, revealing structure where ordinary light will not do so.

(c) *Circular polarization*: If two rectangular, equal impulses are given to a pendulum, or to a stretched coil, one of them a quarter vibration later than the other, the two are compounded into a single circular orbit. Therefore, if a beam of plane polarized light

đól, bôy; pōit, jōwł; cat, çell, chorus, çhin, beñç: go, gcm: thin, this: sin, aş; expect, Xçnophon, exist, ph = f. -cian. tian = şan. -tion, -sion = şùn; tion, şion = zhùn. -cius, tius, -sious = şşus. bic, die, &c. = beł, del.

the light is plane-polarized, through a thin film of selenite, the thickness of which is such that only vibrating sets of waves are allowed to pass, whilst in the film one wave is retarded behind the other, the two waves, when they emerge, are not in phase, and the light is elliptically polarized. At approximately right angles, the light is elliptically polarized in the opposite sense, and is never stopped by the analyzer, but differs from common light in producing polarized effects. The most important of these is:

(1) Polarization by reflection. Vary the former experiment by passing the light from the polarizing Nicol, with its vibrations in a vertical plane, through a plate of selenite or mica which gives true colour, the vibrations are then in the two diagonal. Let this light now traverse a spiral wave-membrane, with its polarizing planes perpendicular and horizontal. Each set of rays from the first plate becomes elliptically polarized, but the two in opposite directions, the circular movements thus opposing each other. Whenever two circular motions thus meet, as in two circular pendulums clashing, the tangential motion is destroyed, and the pendulums would both fall back together through the centre of the former orbit. It is so in this case; but as one set of rays has been retarded in the plates more than the other, the swing of the vibrations is no longer in the original plane of vibration. Let that plane be *A, C*; instead of the two circular waves meeting at *o*, again, as they would if both circular motions were equally rapid, the meeting-point will be somewhere on one side or other of it, as at *m*. There the right-handed ray will meet the left-handed ray, the tangential motions *nm, cm*, will be destroyed, and the radial forces in the plane of vibration swing about *m*, passing through the centre *o*. If, therefore, light of one wave-length or colour be employed, instead of the analyzer having to be turned across *A, C* to extinguish it, it must now be turned across *m, n*; in other words, the original plane of polarization has been rotated. If white light be employed, the many various wave-lengths will obviously meet at different points, and hence rotation of the analyzer will give in succession more or less of the colours of the spectrum. If the quarter-wave film is cut in half, and its position reversed in one half, the transition of colours will occur in opposite orders in the two halves. Rotatory polarization is of the greatest practical importance. There are many crystals, plate of which, when cut in proper directions, produce naturally all the phenomena of the double plate described above. Many fluids, such as oil of lemons, turpentine, and solution of cane sugar, also show the same phenomena very strongly, and in their case it is remarkably connected with the presence in the molecule of what chemists call "asymmetrical atoms." In solutions, as of sugar, the amount of rotation is proportionate to the quantity of sugar in solution in a given column of fluid, hence the "determination" of crystallizable sugar, whenever an amount is required, is now always made by the polariscope. First discovered, in 1845, that the property of rotatory polarization was confined upon any transparent body when the axis of the ray employed was made the axis of symmetry, solution of strong magnetic field. [POLARIZATIONS.]

symmetrically alike all round the circumference. If we cut a plate in the way of a plank, it will behave like the films already spoken of. But if a sheet be cut across the trunk at right angles it must be different, when a ray of light passes through in the direction of the axis. The other vibrations are at right angles to the path of the ray (now the same as the axis), but in all these directions, the elasticity is equal, consequently a beam of common light will not be doubly refracted, nor a beam of plane-polarized light further resolved, in passing along the axis. This is borne out by cutting a plate of calcite at right angles to its axis. But if the ray passes through such a plate obliquely, double refractions and interference will come into action, and we shall perceive colour. Imagine now a conical or strongly convergent pencil of plane-polarized light traversing the plate, and the analyzer turned so as to extinguish the light passing the polarising Nicol. The centre of the plate, where the beam is truly axial, will still appear dark. But, as the light becomes more and more oblique, the vibrations will be resolved into some plane passing through the axis and planes at right angles to these, or tangential planes. In perpendicular and horizontal planes, these will cause no further resolution of the vibrations, and there will therefore be a black cross when the analyzer is crossed; but in all other planes, the more and more oblique light must cause successive rings of light and darkness, or, when white light is employed, of colour, as shown in fig. A. In crystals which are not perfectly symmetrical about one axis, the ideal structure may be compared to that of a tree-trunk of an oval section. Here, a plank would still give two polarizing planes, as in a thin of selenite; but a transverse section would also show two rectangular elasticities. In such a case, analysis proves that there must be two lines or axes inclined to each other, in which there can be no double refraction, and that the fringes of colour must take the general shape of lemniscates, as shown in fig. B. In many crystals the properties are quite different for light of different wave-lengths, and in some, the plane of the axes is at right angles for one end of the spectrum to what it is for the other. The relation of the elasticities may also be profoundly changed by heating the crystal, so that the intermediate one becomes greatest or least; in such cases, as in heating selenite, the double rings of a gradually merge into one as at A, and then the two rings spread out again in a direction at right angles to the former. Generally, it may be said that cubic crystals possess no double refraction; that crystals symmetrical round one axis are uniaxial, doubly-refracting, and exhibit circular rings; and that other crystals are bi-axial, and exhibit double rings. All these phenomena are of the greatest importance in the study of rocks, and the fragments of crystals embedded in them.

(1) In the same sense as II. 1.

(2) The pole-star.

(3) The firmament, the sky.

2. *Elect. (Pl.)*: The same as ELECTRODES (q.v.).

3. *Magnetism (Pl.)*: The two points at opposite ends of a magnetic bar where the attraction is greatest. One points to the north and is called the North Pole, the other to the south and is called the South Pole. Similar poles repel, dissimilar poles attract each other. Sometimes there are intermediate poles, called "consequent poles." When the earth is viewed as a magnet, the spots where the magnetic needle stands vertical are called the "magnetic poles." In 1830 Sir James Ross found that the magnetic north pole was in 76° N. and the 47° W. At the same time the position of the magnetic south pole was calculated to be in 73° S. and 154° E. But it does not always retain the same place. This is shown by what is called the declination or variation of the magnetic needle, i.e., the angle which it makes with the geographical meridian. At London, in 1850, this was 11° 36' E., and in 1893, 17° 11' W.

4. The unit magnetic pole, or the pole of unit strength, is that which repels an equal pole at unit distance with unit force. In the C. G. S. system it is the pole which repels an equal pole at the distance of one centimetre with a force of one degree. (Everett: *The U. S. System of Units*, ch. x.)

5. *Math.*: In a polar system of coordinates, the point from which the radius vector of any point is estimated.

6. *Math. Geog. (Pl.)*: The two extremities of the earth's axis, i.e., the two points where the axis meets its surface. That above the horizon in our latitude is called the North Pole, the other, on the further side of the globe, is called the South Pole.

"From pole to pole is undistinguished blue,"
Thompson, Summer, 398.

7. (1) *Pole of a polar line*: A point in the plane of a conic section, such that, if any straight line be drawn through it, cutting the curve in two points, and tangents be drawn to the curve at these points, they will intersect each other on the given line.

(2) *Pole of maximum cold*:

Temperature: A point where the cold is greater than anywhere around.

(3) *Poles of a circle of a sphere*: The points in which a diameter of the sphere perpendicular to the plane of the circle pierces the surface of the sphere.

pole star, *s.*

Astron.: Polaris, a bright star at the tip of the tail of Ursa Minor, and in a line with the pointers Merak and Dubhe, the two stars constituting the front of the plough-like figure in Ursa Major. It is at present less than a degree and a half from the true pole, and by A. D. 2095, through the precession of the equinoxes, it will be under half a degree. [PRECESSION.] Even now the circle it describes is too small to be discernible by the ordinary eye. The pole-star is really a double star of yellow hue, but while the larger or visible one is between the second and third magnitude, its companion is only of the ninth, and therefore a telescopic star. There is no corresponding star in the southern hemisphere. The pole-star is a convenient one for observing to determine the latitude and also the azimuthal error of any transit-instrument.

1. Common: A document containing a promise

to pay a certain sum of money on the occurrence of some event. In return for this promise a sum of money is paid down, called the premium (Fr.). By far the largest part of insurance business is applied to disasters at sea; to destruction of property by fire; to making provision for heirs and successors in case of death, and to loss of time and expense through accident. The practice of insurance has also been extended to making provision against loss of crops from bad weather, against destruction of glass from storms and accidents, &c. In every case a form is filled up containing a promise to pay a certain sum in the event of the happening of the specified contingency, and this document is always called the policy. Although an insurance policy is a contract, it is only signed by one party, the insurer, who for that reason is called the underwriter, and forms, therefore, what is called in law an unilateral contract. Marine policies are of two kinds: (1) Valued policy, one in which the goods or property insured are at a specified value; (2) Open policy, one in which the value of the goods or property is not mentioned. [ASSURANCE, INSURANCE.]

Compar. Relig.: The worship of many gods. It is not necessarily the same as idolatry, for gods may be adored without any image of them being made. In Sir John Lubbock's classification of religious beliefs, Fetichism and Totemism are polytheistic; the next stage in the ascending order, Anthropomorphism, may or may not be so. No mention is made in Scripture of Polytheism before the flood. It existed among the ancestors of Abraham in Ur of the Chaldees (Joshua xiv. 2). The first commandment is levelled against it (Exod. xx. 3, Deut. v. 7). It was common at the time among the Canaanites (Deut. vi. 14, vii. 1, &c.). At many periods the Jews, high and low, lapsed into it (1 Kings xiv. 2; 2 Kings xvii. 16, 17; Ezek. viii. 3-18). Though some of the Greek and Roman philosophers may have risen above polytheism to conceive the unity of God, the masses of the people were polytheistic, as is the case with the ethnic nations to-day, though in some cases, as in that of India, pantheism underlies polytheism, and some apparent polytheists really believe all nature to be one God.
